Domestication and early experiences in chickens Pia Katrine

Løtvedt, 2017-11-17 A number of animal species have undergone domestication the process of becoming adapted to living in captivity and in proximity to humans Common for these species is that they have all developed certain traits including changes to coat color body size and level of fearfulness This has been termed the domestic phenotype Among these traits is also an attenuation of the response to stress both behaviorally and physiologically Thus release of glucocorticoids such as cortisol or corticosterone is lower in domesticated species However the underlying mechanism for this is not yet well understood In this thesis we have investigated genetic mechanisms for the attenuation of the physiological stress response in ancestral chickens the Red Junglefowl and domesticated chickens the White Leghorn We found a number of genes that differed in expression between the two breeds in several tissues involved in the stress response Among the most interesting findings were lower expression of genes involved in production and secretion of ACTH in the pituitary and in the production of glucocorticoids in the adrenal glands in the domesticated White Leghorns We also found higher expression of the glucocorticoid receptor in White Leghorns indicating that they may have a more efficient negative feedback of the physiological stress response We then investigated the transcriptome of the chicken pituitary more closely and we discovered

that a number of genes highly involved in several important physiological axes showed differential expression between the ancestral and the domesticated breed. Among these were genes involved in the stress response, the reproductive system, and in metabolism and growth. As these traits are modified in domesticated species, our results suggest that changes to gene expression in the pituitary may be an important underlying factor of the domestic phenotype. A separate aim of this thesis was to investigate effects of hatching time in chickens on their subsequent phenotype. Time of hatching constitutes an early experience that may differ between individuals, and we therefore hypothesized that differences in hatching time would affect chickens later in life. While a number of studies have been performed on hatching time and post-hatch growth, very little work has been done on effects on behavior. We found that the time of hatching had sex-specific effects. Hatching times in females were negatively correlated with body weight, whereas in males, behaviors such as reaction to novelty and spatial learning were affected. As time of hatching is governed by various hormones, including thyroid hormone and corticosterone, we suggest that changes to the levels of these hormones could affect both hatching time and post-hatch phenotypes. Understanding these mechanisms better would be beneficial in terms of production, where batch homogeneity is important, in research on early experiences, and the potential for maternal programming, and in evolutionary questions on trade-off between different life strategies.

The Melanotropic Peptides M.E. Hadley, 2018-01-18. The three volumes on *The Melanotropic Peptides* are the outcome of a conference of the same name that was held in Tucson, Arizona, from October 11-12, 1986. Volume II discusses the diverse putative physiological roles of MSH and MCH. A concluding chapter of this volume provides a discussion of the possible evolutionary relationships between MSH and MCH in the control of color change.

Vertebrate Endocrinology David O. Norris, 2006-11-27. One of the only books to discuss all vertebrates, the fourth edition of *Vertebrate Endocrinology* has been completely reorganized and updated to explore the intricate mechanisms that control human physiology and behavior, as well as that of other vertebrate animals. Perfect for students in endocrinology, zoology, biology, and physiology, it allows readers to gain both an understanding of the intricate relationships among all of the body systems and their regulation by hormones and other bioregulators, but also a sense of their development through evolutionary time, as well as the roles of hormones at different stages of an animal's life cycle. Chapters have been reorganized to more closely follow traditional classroom presentation, and extensive suggested readings are included at the end of each chapter, allowing the reader to obtain further information, as well as connect concepts to the literature on which the book is based. For the first time, this edition features four color illustrations. Provides a complete overview of the endocrine system of vertebrates by first emphasizing the mammalian system as the basis of most terminology and understanding of endocrine mechanisms, and then applies that to non-mammals. Introduces the reader to suitable concepts and explanation of jargon so that the reader will be able to delve directly into the primary literature on any endocrine-related topic with a background that will aid in their interpretation of new information. Revised and updated chapter on The Molecular Bases for Chemical Regulation that now

includes more evolutionary data Includes information on endocrine disrupting chemicals and their implications on the health of wildlife and humans

An Introduction to Neuroendocrinology Richard E. Brown, 1994-01-27 This book is designed as an introductory text in neuroendocrinology the study of the interaction between the brain and endocrine system and the influence of this on behaviour The endocrine glands pituitary gland and hypothalamus and their interactions and hormones are discussed The action of steroid and thyroid hormone receptors and the regulation of target cell response to hormones is examined The function of neuropeptides is discussed with respect to the neuroendocrine system and behaviour The neuroimmune system and lymphokines are described and the interaction between the neuroendocrine and neuroimmune systems discussed Finally methods for studying hormonal influences on behaviour are outlined Each chapter has review and essay questions designed for advanced students and honours or graduate students with a background in neuroscience respectively

Advances in the Study of Behavior, 2022-04-28 Advances in the Study of Behavior Volume 54 highlights new advances in the field with this new volume presenting interesting chapters on Mobbing in animals a thorough review and proposed future directions Learned components of courtship a focus on gestures choreographies and construction abilities Sexual selection in the true bugs and Brain behavior relationships of cognition in vertebrates lessons from amphibians Pre Copulatory and Copulatory Courtship in Male Dimorphic Arthropods Provides the authority and expertise of leading contributors from an international board of authors Presents the latest release in Advances in the Study of Behavior Updated release includes the latest information on Advances in the Study of Behavior

Social Behavior and Communication P. Marler, 2013-03-09 Other books in this series focus on behavior at the individual level approached from the viewpoints of biochemistry anatomy physiology and psychology In this volume we show how the functioning nervous systems of interacting individuals are coordinated with the ultimate creation of complex social structures The intricacies of an individual's nervous system have been subject to intense inquiry and research at the chemical cellular and organ levels has made remarkable progress Work at the social level has been conducted somewhat independently by way of behavioral phenomena and communicative interactions With the emergence of a large body of information from neurobiology the beginnings of an integrated approach are possible New data on social functions are presented in the chapters to follow and the forward looking reader may wish to reflect on how they clarify understanding of interactions between two or more independent nervous systems The outcome is harmonious social structure and improvement in the inclusive fitness of group living individuals We believe that there is in prospect a new way of looking at social function that will ultimately increase our understanding of the highest and most complex levels of neurobiology The modern approach to the study of social behavior involves more than the recording of interactions between

animals Each individual brings to the process of social interaction the implications of its prior genetic and experiential history
