## **ECAM**

The ECAM (Electronic Centralized Aircraft Monitoring) system is made up of two primary components, two SDAC's (System Data Acquisition Concentrators) and two FWC's (Flight Warning Computers). A loss of only one SDAC or only one FWC will not result in any loss of function. The second computer can handle all functions alone. The SDAC's receive data from sensors and will send signals to 3 DMC's (Display Management Computer) which generate the screen image. The SDAC's also send signals to the FWC. The FWC will generate various warning/caution messages.

The E/WD (Engine/Warning Display) is the display that shows normal engine readings and ECAM messages. The SD (System Display) is directly below the E/WD and normally shows system pages or status. For information on switching screens in case of failures see EFIS later in this section.

ECAM uses color to indicate the importance of the indication--

RED:	Immediate action required
ORANGE (AMBER):	Awareness but no action required
GREEN:	Normal operation
WHITE:	Titles and remarks
BLUE (CYAN):	Actions to be carried out or limitations
PURPLE (MAGENTA):	Special messages (i.e. inhibition messages)

**Note:** pulsing green or amber indications are approaching limits

If a FWC fails the Master Caution and Master Warning lights will indicate the failure (along with a warning from ECAM) by the upper or lower light in both the Master Caution and Warning light being out. If the #1 FWC fails then the captain's upper lights would be out and the F/O's lower lights would be out. If #2 FWC fails the reverse lights will go out.

Loss of both FWC's will result in a loss of most warning capability. The dual failure of the FWC's will result in an amber caution with no sound.

ECAM system pages are controlled through the ECAM control panel. Captains will be using the mnemonic FUEL to check systems prior to departure.

F FUEL, balance, configuration, quantity  
H HYD, Hydraulics quantity (painters in boxes)  
E ENG, Engine oil quantity (min. 12.5 gals.)  
D DOOR/OXY, Doors armed, O2 pressure (note: overwing slides always armed)

**Note:** Press FUEL, HYD, ENG and then press ENG again to return to default DOOR/OXY page.

Binary Decision Diagrams and Extensions for System Reliability Analysis Liudong Xing, Suprasad V. Amari, 2015-06-05

Recent advances in science and technology have made modern computing and engineering systems more powerful and sophisticated than ever. The increasing complexity and scale imply that system reliability problems not only continue to be a challenge but also require more efficient models and solutions. This is the first book systematically covering the state of the art binary decision diagrams and their extended models which can provide efficient and exact solutions to reliability analysis of large and complex systems. The book provides both basic concepts and detailed algorithms for modelling and evaluating reliability of a wide range of complex systems such as multi state systems, phased mission systems, fault tolerant systems with imperfect fault coverage, systems with common cause failures, systems with disjoint failures, and systems with functional dependent failures. These types of systems abound in safety critical or mission critical applications such as aerospace circuits, power systems, medical systems, telecommunication systems, transmission systems, traffic light systems, data storage systems, and etc. The book provides both small scale illustrative examples and large scale benchmark examples to demonstrate broad applications and advantages of different decision diagrams based methods for complex system reliability analysis. Other measures including component importance and failure frequency are also covered. A rich set of references is cited in the book providing helpful resources for readers to pursue further research and study of the topics. The target audience of the book is reliability and safety engineers or researchers. The book can serve as a textbook on system reliability analysis. It can also serve as a tutorial and reference book on decision diagrams, multi state systems, phased mission systems, and imperfect fault coverage models.
