Team and Collective Training Needs Analysis John Huddleston, Jonathan Pike, 2017-07-12 Military capability is delivered operationally at a team and collective level be it a unit as small as a squad or section or as large as a maritime task group Modern military forces are required to deal with a potentially wide range of missions frequently involving multiple alliance partners within a geopolitical environment which can seem to change rapidly Individual performance while being important is not the primary determinant of mission success force integration interoperability adaptability and teamwork are key factors Team and collective training which fully addresses these factors is fundamental to the development and delivery of military capability As a consequence the requirement to determine training requirements and specify effective systems for the delivery of team and collective training is critical to operational success Training Needs Analysis also known as Front End Analysis is a well established methodology

for analysing training requirements and specifying training solutions used extensively by the UK and its NATO partners. However, the analytical techniques employed are optimised for individual training with little guidance being offered on its application in the team and collective context. Team and Collective Training Needs Analysis (TCTNA) has been developed to close this methodological gap. It addresses the issues of the relationship of individual and team tasks, teamwork, command and control, task and training environments, scenario definition, instructional strategy, team training approaches, instructional functions and wide ranging organisational and procurement considerations. Part One of the book develops an integrated set of models which underpin the analytical approach presented in Part Two. Worked examples and case studies illustrate the application of the approach. Between 2005 and 2015 the authors worked on numerous training related research projects at Cranfield University and Coventry University for the Human Factors Integration Defence Technology Centre and the Defence Human Capability Science and Technology Centre on behalf of the Defence Science and Technology Laboratory, UK Ministry of Defence.

Maintenance for Industrial Systems Riccardo Manzini, Alberto Regattieri, Hoang Pham, Emilio Ferrari, 2009-11-09. New global and extended markets are forcing companies to process and manage increasingly differentiated products with shorter life cycles, low volumes and reduced customer delivery times. In today's global marketplace, production systems need to be able to deliver products on time, maintain market credibility and introduce new products and services faster than competitors. As a result, a new production paradigm of a production system has been developed and a supporting management decision making approach simultaneously incorporating design management and control of the production system is necessary so that this challenge can be effectively and efficiently met. Maintenance Engineering and its Applications in Production Systems meets this need by introducing an original and integrated idea of maintenance for productivity. The volume starts with the introduction and discussion of a new conceptual framework based on productivity, quality and safety supported by maintenance. Subsequent chapters illustrate the most relevant models and methods to plan, organise, implement and control the whole maintenance process, reliability evaluation models and prediction, maintenance strategies and policies, spare parts management, computer maintenance management software (CMMS) and total productive maintenance (TPM) etc. Several examples of problems supported by solutions and real applications to help and test the reader's comprehension are included. Maintenance Engineering and its Applications in Production Systems will certainly be valuable to engineering students, doctoral and post doctoral students and also to maintenance practitioners as well as managers of industrial and service companies.
