Answer the following questions regarding the kinetics of chemical reactions.

- (a) The diagram below at right shows the energy pathway for the reaction $\text{O}_3 + \text{NO} \rightarrow \text{NO}_2 + \text{O}_2$. Clearly label the following directly on the diagram.

- (i) The activation energy (E_a) for the forward reaction
 - (ii) The enthalpy change (ΔH) for the reaction
- (b) The reaction $2 \text{N}_2\text{O}_5 \rightarrow 4 \text{NO}_2 + \text{O}_2$ is first order with respect to N_2O_5 .
- (i) Using the axes at right, complete the graph that represents the change in $[\text{N}_2\text{O}_5]$ over time as the reaction proceeds.

- (ii) Describe how the graph in (i) could be used to find the reaction rate at a given time, t .
 - (iii) Considering the rate law and the graph in (i), describe how the value of the rate constant, k , could be determined.
 - (iv) If more N_2O_5 were added to the reaction mixture at constant temperature, what would be the effect on the rate constant, k ? Explain.
- (c) Data for the chemical reaction $2\text{A} \rightarrow \text{B} + \text{C}$ were collected by measuring the concentration of A at 10-minute intervals for 80 minutes. The following graphs were generated from analysis of the data.

Chains Julio B. Clempner, Alexander Poznyak, 2023-12-13 This book considers a class of ergodic finite controllable Markov chains The main idea behind the method described in this book is to develop the original discrete optimization problems or game models in the space of randomized formulations where the variables stand in for the distributions mixed strategies or preferences of the original discrete pure strategies in the use The following suppositions are made a finite state space a limited action space continuity of the probabilities and rewards associated with the actions and a necessity for accessibility These hypotheses lead to the existence of an optimal policy The best course of action is always stationary It is either simple i.e nonrandomized stationary or composed of two nonrandomized policies which is equivalent to randomly selecting one of two simple policies throughout each epoch by tossing a biased coin As a bonus the optimization procedure just has to repeatedly solve the time average dynamic programming equation making it theoretically feasible to choose the optimum course of action under the global restriction In the ergodic cases the state distributions generated by the corresponding transition equations exponentially quickly converge to their stationary final values This makes it possible to employ all widely used optimization methods such as Gradient like procedures Extra proximal method Lagrange's multipliers Tikhonov's regularization including the related numerical techniques In the book we tackle different problems and theoretical Markov models like controllable and ergodic Markov chains multi objective Pareto front solutions partially observable Markov chains continuous time Markov chains Nash equilibrium and Stackelberg equilibrium Lyapunov like function in Markov chains Best reply strategy Bayesian incentive compatible mechanisms Bayesian Partially Observable Markov Games bargaining solutions for Nash and Kalai Smorodinsky formulations multi traffic signal control synchronization problem Rubinstein's non cooperative bargaining solutions the transfer pricing problem as bargaining *California Science*, 2008 Science stimulates curiosity and student inquiry integrates powerful support for reading and science literacy reaches all learners through numerous components and strategies for differentiated instruction reinforces learning through exciting visuals and electronic components and makes teaching science easy with a variety of teacher resources *ERDA Energy Research Abstracts* United States.
