

Phylogenetic Trees

How do the changes in gene sequences allow us to reconstruct the evolutionary relationships between related species?

Why?

The saying "Don't judge a book by its cover." could be applied to the topic of evolution. For example, humans share 75% of their DNA with chickens. Biologists point to this as evidence that humans and chickens once shared a common ancestor. The advent of DNA technology has given scientists the tools with which to examine how closely related certain species are. DNA analysis allows scientists to construct phylogenetic trees whose branches link together the relatedness of different organisms.

Model 1 – Phylogenetic Trees

1. Refer to Model 1.
 - a. How long ago did the common ancestor of all the organisms on this phylogenetic tree exist?
 - b. Which two lines diverged 30 million years ago?
 - c. List all modern descendants of the organism that was alive at the point indicated by the asterisk.

Specialised membrane domains of plasmodesmata, plant intercellular nanopores Jens Tilsner, Emmanuelle

Bayer, Sébastien MONGRAND, Lesley Torrance, 2014-12-17 Plasmodesmata PD are plant specific intercellular nanopores defined by specialised domains of the plasma membrane PM and the endoplasmic reticulum ER both of which contain unique proteins and probably different lipid compositions than the surrounding bulk membranes The PD membranes form concentric tubules with a minimal outer diameter of only 50 nm and the central ER strand constricted to 10-15 nm representing one of the narrowest stable membrane tubules in nature This unique membrane architecture poses many biophysical structural and functional questions PM continuity across PD raises the question as to how a locally confined membrane site is established and maintained at PD There is increasing evidence that the PM within PD may be enriched in membrane rafts or TET web domains Lipid rafts often function as signalling platforms in line with the emerging view of PD as central players in plant defense responses Lipid lipid immiscibility could also provide a mechanism for membrane sub compartmentalisation at PD Intricate connections of the PM to the wall and the underlying cytoskeleton and ER may anchor the specialised domains locally The ER within PD is even more strongly modified Its extreme curvature suggests that it is stabilised by densely packed proteins potentially members of the reticulon family that tubulate the cortical ER The diameter of the constricted ER within PD is similar to membrane stalks in dynamin mediated membrane fission during endocytosis and may need to be stabilised against spontaneous rupture The function of this extreme membrane constriction and the reasons why the ER is connected between plant cells remain unknown Whilst the technically challenging search for the protein components of PD is ongoing there has been significant recent progress in research on biological membranes that could benefit our understanding of PD function With this Research Topic we therefore aim to bring together researchers in the PD field and those in related areas such as membrane biophysics membrane composition and fluidity protein lipid interactions lateral membrane heterogeneity lipid rafts membrane curvature and membrane fusion fission We wish to address questions such as What mechanisms restrict lateral mobility of proteins and lipids along the PD membranes How can specific proteins be targeted to and turned over from membrane domains with restricted lateral access What elements lipids proteins membrane curvature packing order thickness etc may contribute to the identity of PD membranes How do the structural and functional features of PD compare to other ER PM contact sites How is the high curvature of the PD ER stabilised and what are possible functions of such a tightly constricted membrane tubule Do PD need to be prevented from spontaneous collapse and sealing What technologies are available to address these questions that can underpin PD research We welcome interested individuals to contribute their expertise and develop new hypotheses on the particular biological and biophysical questions posed by PD We are particularly looking for articles Original Research Articles Technical Advances and State of the Art reviews that would expand on or challenge current perceptions of PD and stimulate discussion *Informational Biopolymers of Genes and Gene Expression* R.D. Evolution Without Selection A. Lima-de-Faria, 1988 The interpretation of evolution is in a state of upheaval the rapid advancement of Molecular Biology has led into question many of the tenets of Darwinism and neo Darwinism which although valuable approaches at the time they were formulated never fulfilled the criteria demanded by real scientific theories In this lucidly written new book now available in paperback the author presents and discusses the rapid developments in particle physics crystallography and molecular biology and formulates a radically different approach to biological evolution This treatise is not offered as one more new theory but a radically different approach In the author's opinion no real theory of evolution can be formulated at present Selection is not the mechanism of evolution for the simple reason that it cannot be weighed on a balance poured into a vial or measured in specific units Only a material component can be the mechanism of evolution and this must be searched for in the strict physico chemical processes
