Molecular Mechanisms of Specialized Metabolites in the Regulation of Plant Development and Stress

Resistance Qing Yang, Chunlong Li, Cankui Zhang, Dong Meng, 2023-11-13 Plant Specialized Metabolisms: Physiological Responses and Molecular Mechanisms Weiwei Zhang, Xiaomeng Liu, Feng Xu, Moonhyuk Kwon, 2025-08-07 Plant specialized metabolites are small molecules or organic compounds such as flavonoids quinones terpenoids alkaloids and phenolic compounds produced by plants They play a role in plant adaptation to the environment such as defending against predators and pests helping with pollination and providing protection against UV damage Some specialized metabolites also have certain physiological activities and pharmacological effects which are of great significance for the prevention and treatment of human tumors aging and cardiovascular diseases The distribution of specialized metabolites in plants is usually unique to species organs tissues and growth stages which leads to complex and diverse biosynthetic pathways of specialized metabolites The synthesis of plant specialized metabolites is controlled by genetic material and regulated by a variety of biotic and abiotic factors in the environment **Biology, the World of Life** Robert A. Ferrandino, Chiara Pagliarani, Eva Pilar Pérez-Álvarez, 2023-10-13 **Brassica Improvement** Shabir Hussain Wani, Ajay Kumar Thakur, Yasin Jeshima Khan, 2020-03-13 Global population is mounting at an alarming stride to surpass 9.3 billion by 2050 whereas simultaneously the agricultural productivity is gravely affected by climate changes resulting in increased biotic and abiotic stresses The genus Brassica belongs to the mustard family whose members are known as cruciferous vegetables

cabbages or mustard plants Rapeseed mustard is world's third most important source of edible oil after soybean and oil palm. It has worldwide acceptance owing to its rare combination of health promoting factors. It has very low levels of saturated fatty acids which make it the healthiest edible oil that is commonly available. Apart from this, it is rich in antioxidants by virtue of tocopherols and phytosterols presence in the oil. The high omega 3 content reduces the risk of atherosclerosis, heart attack. Conventional breeding methods have met with limited success in Brassica because yield and stress resilience are polygenic traits and are greatly influenced by environment. Therefore, it is imperative to accelerate the efforts to unravel the biochemical, physiological and molecular mechanisms underlying yield, quality and tolerance towards biotic and abiotic stresses in Brassica. To exploit its fullest potential, systematic efforts are needed to unlock the genetic information for new germplasms that tolerate initial and terminal state heat coupled with moisture stress. For instance, wild relatives may be exploited in developing introgressed and resynthesized lines with desirable attributes. Exploitation of heterosis is another important area which can be achieved by introducing transgenics to raise stable CMS lines. Doubled haploid breeding and marker assisted selection should be employed along with conventional breeding. Breeding programmes aim at enhancing resource use efficiency, especially nutrient and water, as well as adoption to aberrant environmental changes should also be considered. Biotechnological interventions are essential for altering the biosynthetic pathways for developing high oleic and low linolenic lines. Accordingly, tools such as microspore and ovule culture, embryo rescue, isolation of trait specific genes, especially for aphid, Sclerotinia and Alternaria blight resistance etc., along with identification of potential lines based on genetic diversity can assist ongoing breeding programmes. In this book, we highlight the recent molecular genetic and genomic interventions made to achieve crop improvement in terms of yield increase, quality and stress tolerance in Brassica, with a special emphasis in Rapeseed mustard.
