The Science of Rainbows

What is a Rainbow?

A rainbow might seem like a fantasy in the mythical world of dragons and fairies instead of the natural world, but there's real science behind the magical display of colors in the sky. In fact, rainbows are multi-layered **bowties**—bends of light that move or disappear when you get close.

For a rainbow to appear, you must be facing away from the sun, and the sunlight must encounter airborne water droplets at a low enough angle. (This is why rainbows happen most often in the morning or later afternoon.) As white light enters a water droplet, it reflects, or bounces, off the back wall, and then results in the dazzling colors you see. Rainbows can be dim or bright, depending on the sun, and they can appear in a period time or all from August or May (and be viewed on both sides).

Remember that they are multi-layered bowties.

- A bowtie is a shape that is wider at the ends than in the middle.
