By using combinatorial and graph theoretic techniques a closer look is taken at infeasible systems of linear inequalities whose generalized solutions act as building blocks of geometric decision rules for pattern recognition. Infeasible systems of linear inequalities prove to be a key object in pattern recognition problems described in geometric terms thanks to the committee method. Such infeasible systems of inequalities represent an important special subclass of infeasible systems of constraints with a monotonicity property: systems whose multi-indices of feasible subsystems form abstract simplicial complexes. Independence systems which are fundamental objects of combinatorial topology. The methods of data mining and machine learning discussed in this monograph form the foundation of technologies like big data and deep learning which play a growing role in many areas of human technology interaction and help to find solutions better solutions and excellent solutions. Contents: Preface, Pattern recognition, infeasible systems of linear inequalities and graphs, Infeasible monotone systems of constraints, Complexes, hyper graphs and inequality systems, Polytopes, positive bases and inequality systems, Monotone Boolean functions, complexes, graphs and inequality systems, Inequality systems, committees, hyper graphs and alternative covers, Bibliography, List of notation, Index.      'Advances in Networks, Security and Communications, Vol. 1 Sergey Yurish, 2018-01-17 The 1st volume of new Advances in Networks Security and Communications Reviews Book Series contains 15 chapters submitted by 42 contributors from 13 countries.
