

Phenomenon: How do plant hormones affect plant growth and development?

Model 1

Seedlings not usually grown in the dark — how do they know where to grow? (Gravity, water, need to be upright, whatever periodical stuff in the garden, but what else? Periods in garden about 10 days and disappear! Periods in the sun — there, about 10 days after harvest? There are several different plant hormones that help to coordinate plant growth, development, ripening, and response to various environmental events.

| Model 1 — Phototropism | | | | |
|--------------------------|---|--|---|---|
| | Control | Group A — Tip covered by cap | Group B — Tip removed | Group C — Tip covered by cap |
| Before exposure to light |  |  |  |  |
| After exposure to light |  |  |  |  |

1. Consider the experiment illustrated in Model 1.

- What is the stimulus in this experiment?
 - What is the plant's response to the stimulus in the control?
2. The characteristic response of plants to sunlight — growing towards light — is called positive phototropism. Learning that "trop" is the Greek word for "turn," explain why this is an excellent term for this phenomenon.
3. How are there experimental groups represented in Model 1?
4. Which experimental group in Model 1 has the same response as the control group?
5. Propose an explanation of why covering the tip of the embryonic night results in a lack of positive phototropism.
6. What additional evidence does the experiment with the "tip covered by cap" group add to?

Model 2a

While following-up experiments showed that if the embryonic tip is separated from the shoot by a piece of "permeable material" made as a block of gelatinous agar, the positive phototropism still occurs. If, however, the tip is separated from the shoot by a piece of "impermeable material" made as a block of wax, then phototropism does not occur.

- What is the major difference in the agar material versus the wax material?
7. How does the observed movement that occurs from the movement of auxin in the shoot tip, which they show is up or down now? Explain how the experiment described in the Model 2a supports the idea that a hormone is involved in phototropism response.

raising public awareness and promoting individual actions such as reducing waste using public transport and supporting climate friendly policies are essential steps in fostering a more sustainable future When people make conscious choices about what they consume how they travel and the waste they generate it contributes to a larger shift towards sustainability The power of individual action lies in its ability to inspire others and create a ripple effect that leads to widespread change For instance in August 2018 at the age of 15 Thunberg began protesting outside the Swedish parliament demanding it to take action to address climate change by adhering to the Paris Agreement and reducing greenhouse gas emissions for keeping global temperature rise below 1.5°C Initially a solitary act her protest inspired millions of young people across the globe to join the movement creating the Fridays for Future movement Through legislation carbon pricing and the promotion of renewable energy sources governments can drive large scale environmental change The Danish government has been a global leader in promoting sustainability through comprehensive policies and actions

Plant Hormones and their Role in Plant Growth and Development P.J. Davies, 2012-12-06 Plant hormones play a crucial role in controlling the way in which plants grow and develop While metabolism provides the power and building blocks for plant life it is the hormones that regulate the speed of growth of the individual parts and integrate these parts to produce the form that we recognize as a plant In addition they play a controlling role in the processes of reproduction This book is a description of these natural chemicals how they are synthesized and metabolized how they work how we measure them and a description of some of the roles they play in regulating plant growth and development This is not a conference proceedings but a selected collection of newly written integrated illustrated reviews describing our knowledge of plant hormones and the experimental work which is the foundation of this knowledge The information in these pages is directed at advanced students and professionals in the plant sciences botanists biochemists molecular biologists or those in the horticultural agricultural and forestry sciences It is intended that the book should serve as a text and guide to the literature for graduate level courses in the plant hormones or as a part of courses in plant or comparative development Scientists in other disciplines who wish to know more about the plant hormones and their role in plants should also find this volume invaluable It is hoped that anyone with a reasonable scientific background can find valuable information in this book expounded in an understandable fashion **Barley John**
