Thermal Ice-prevention Equipment for the B-17F Airplane Alun R. Jones,Lewis A. Rodert,1943 The basic idea in the design of
 the system described was to raise the temperature of the surfaces to be protected from ice formations by subjecting the inner
 faces to a stream of heated air The sources of heated air were three exhaust gas to air heat exchangers one located in each
 outboard nacelle A double skin type of construction was employed over the forward portion of the wings and tail surfaces The
 heated air was caused to circulate by the dynamic pressure of the air stream **Dental Technician, Repair** United States.
