

Light Microscopy

First microscopes used visible light to create images and used little magnifying power. Today, more sophisticated compound light microscopes (Figure 3-1) are used routinely in microbiology laboratories. The various types of light microscopes include bright-field, dark-field, fluorescence, and phase-contrast microscopes (Figure 3-2). Although each method has specific applications and advantages, the one used most commonly in microbiology classes and clinical laboratories is bright-field microscopy. Many research applications use electron microscopes because of its ability to produce higher quality images of greater magnification.

3-1 **Compound Microscope** A compound microscope is an optical instrument that is constructed with two separate optical systems to achieve high magnification.
