Genetics Joins Evolutionary Theory

Genetics Joins Evolutionary Theory

Gregor Mendel's experiments with pea plants demonstrated segregation.

- 1. Mendel's experiments demonstrated that traits are controlled by genes and that these genes behave in predictable ways in crosses. These predictable differences in an individual's appearance, known as phenotypes, are affected by its genotype.
- 2. Genes are passed from one generation to the next in populations. Individuals in a population share a common group of genes, called a gene pool.
- 3. Allele frequency is the number of copies an allele occurs in a gene pool. Genotype frequency is the number of copies of a pair of alleles that the study population has. Genotype, gene, individual, and allele frequency change over time.

Examples of Genetic Variation Variation can be caused by genetic recombination, mutation, genetic drift, and natural selection.

- 1. Genetic drift is any change in frequency of allele.
- 2. Genetic drift is a change in the frequency of alleles in a population. This occurs during random mating. Genetic drift is most likely to occur in small populations. Genetic drift is most likely to occur in small populations.
- 3. Genetic drift is a change in the frequency of alleles in a population. This occurs during random mating. Genetic drift is most likely to occur in small populations. Genetic drift is most likely to occur in small populations.

Single Gene and Polygenic Traits Mendel's experiments with pea plants demonstrated that single gene traits are controlled by one gene.

- 1. Single gene trait is controlled by one gene. An example is pea color. Mendel's experiments demonstrated that single gene traits are controlled by one gene.
- 2. Polygenic trait is controlled by more than one gene. An example is human height. Polygenic traits are controlled by more than one gene.
