Borgstrom, 2014-11-03 This unique reference fulfills the unmet need of a textbook that addresses the scope of practice for surgeons practicing in rural regions. Written by experts in each subspecialty, the text focuses on procedural aspects of surgical patient care. The first section discusses practice issues unique to rural surgery and provides an overview of applying principles of quality improvement to surgical practice. Subsequent chapters cover specific surgical procedures. Each chapter includes a brief discussion of indications and contraindications for surgery. The surgical technique is described with attention to important anatomic details. Key portions of the procedure are highlighted including potential complications and how to avoid them. Procedure specific perioperative care is also discussed. Reavis, 2016-02-04 This manual presents a comprehensive and state of the art approach to the diverse applications of surgical techniques and procedures through the endoscopic platform. Sections address preliminary issues faced by surgeons and physicians who may be initially undertaking these new techniques. These areas include training and credentialing as well as tools and platforms commonly used for these procedures. Subsequent chapters focus on specific disease processes and the endoscopic applications for those procedures. Each section addresses patient selection, pre-operative considerations, technical conduct of the most common operations, and avoiding complications. A brief review of the existing literature addressing the particular topic follows in each section. The text concludes with chapters on future directions and device development. Written by experts in the field, *The SAGES Manual: Operating Through the Endoscope* is a valuable resource to experienced advanced endoscopists looking to expand the types of procedures that they currently perform as well as trainees including residents, fellows, and medical students.

Appropriate Use of Advanced Technologies for Radiation Therapy and Surgery in Oncology National Academies of Sciences, Engineering, and Medicine, Institute of Medicine, Board on Health Care Services, National Cancer Policy Forum, 2016-04-16 In recent years, the field of oncology has witnessed a number of technological advances including more precise radiation therapy and minimally invasive surgical techniques. Three-dimensional 3D stereotactic and proton beam radiation therapy as well as laparoscopy and robotic surgery can enhance clinicians' ability to treat conditions that were clinically challenging with conventional technologies and may improve clinical outcomes or reduce treatment-related problems for some patients. Both patients and physicians seek access to these new technologies which are rapidly being

adopted into standard clinical practice Such demand is often propelled by marketing that portrays the new technologies as the latest and greatest treatments available However evidence is often lacking to support these claims and these novel technologies usually come with higher price tags and are often used to treat patients who might have achieved similar benefits from less expensive conventional treatment The increased cost of novel treatments without adequate assessment of how they affect patient outcomes is a pressing concern given that inappropriate use of expensive technologies is one of the key factors that threaten the affordability of cancer care in the United States To explore these issues further the National Cancer Policy Forum NCPF of the Institute of Medicine organized a workshop in July 2015 This is the third NCPF workshop in a series examining the affordability of cancer care Participants explored clinical benefits and comparative effectiveness of emerging advanced technologies for cancer treatment in radiation therapy and surgery and potential strategies to assess the value and promote optimal use of new technologies in cancer treatment This report summarizes the presentations and discussions from the workshop

Imaging in Biology and Medicine Ch.W. Sensen, Benedikt Hallgrimsson, 2008-12-03 A picture says more than a thousand words This is something that we all know to be true Imaging has been important since the early days of medicine and biology as seen in the anatomical studies of Leonardo Da Vinci or Andreas Vesalius More than 100 years ago the first noninvasive imaging technologies such as K rad Roentgen's X ray technology were applied to the medical field and while still crude revolutionized medical diagnosis Today every patient will be exposed to some kind of advanced imaging technology such as medical resonance imaging computed tomography or four dimensional ultrasound during their lifetime Many diseases such as brain tumors are initially diagnosed solely by imaging and most of the surgical planning relies on the patient imagery 4D ultrasound is available to expecting parents who wish to create unique early memories of the new baby and it may soon be used for the morphometric diagnosis of malformations that may one day be treatable in utero Light and electron microscopy are unequal brethren which have contributed to most of our knowledge about the existence and organization of cells tissues and microorganisms Every student of biology or medicine is introduced to the fascinating images of the microcosm New

advances have converted these imaging technologies which were considered by many to be antiquated into powerful tools for research in systems biology and related fields
