Transients of Modern Power Electronics Hua Bai, Chris Mi, 2011-07-05 In high power high voltage electronics systems a strategy to manage short timescale energy imbalances is fundamental to the system reliability Without a theoretical framework harmful local convergence of energy can affect the dynamic process of transformation transmission and storage which create an unreliable system With an original approach that encourages understanding of both macroscopic and microscopic factors the authors offer a solution They demonstrate the essential theory and methodology for the design modeling and prototyping of modern power electronics converters to create highly effective systems Current applications such as renewable energy systems and hybrid electric vehicles are discussed in detail by the authors Key features offers a logical guide that is widely applicable to power electronics across power supplies renewable energy systems and many other areas analyses the short scale nano micro second transient phenomena and the transient processes in nearly all major timescales from device switching processes at the nanoscale level to thermal and mechanical processes at second level explores transient causes and shows how to correct them by changing the control algorithm or peripheral circuit includes two case studies on power electronics in hybrid electric vehicles and renewable energy systems Practitioners in major power electronic companies will benefit from this reference especially design engineers aiming for optimal system performance It will also be of value to faculty staff and graduate students specializing in power electronics within academia
