Introduction to Geometry of Manifolds with Symmetry V.V. Trofimov, 2013-04-17 One of the most important features of the development of physical and mathematical sciences in the beginning of the 20th century was the demolition of prevailing views of the three dimensional Euclidean space as the only possible mathematical description of real physical space. Apriorization of geometrical notions and identification of physical 3 space with its mathematical model were characteristic for these views. The discovery of non Euclidean geometries led mathematicians to the understanding that Euclidean geometry is nothing more than one of many logically admissible geometrical systems. Relativity theory amended our understanding of the problem of space by amalgamating space and time into an integral four dimensional manifold. One of the most important problems lying at the crossroad of natural sciences and philosophy is the problem of the structure of the world as a whole. There are a lot of possibilities for the topology of four dimensional space time and at first sight a lot of possibilities arise in cosmology. In principle not only can the global topology of the universe be complicated but also smaller scale topological structures can be very nontrivial. One can imagine two usual spaces connected with a throat making the topology of the union complicated.

Applications Of Contact Geometry And Topology In Physics Arkady L Kholodenko, 2013-05-03 Although contact geometry and topology is briefly discussed in V I Arnol'd's book *Mathematical Methods of Classical Mechanics* Springer Verlag 1989 2nd edition it still remains a domain of research in pure mathematics e.g. see the recent monograph by H Geiges *An Introduction to Contact Topology* Cambridge U Press 2008. Some attempts to use contact geometry in physics were made in the monograph *Contact Geometry and Nonlinear Differential Equations* Cambridge U Press 2007. Unfortunately even the excellent style of this monograph is not sufficient to attract the attention of the physics community to this type of problems. This book is the first serious attempt to change the existing status quo. In it we demonstrate that in fact all branches of theoretical physics can be rewritten in the language of contact geometry and topology from mechanics thermodynamics and electrodynamics to optics gauge fields and gravity from physics of liquid crystals to quantum mechanics and quantum computers etc. The book is written in the style of famous Landau Lifshitz L L multivolume course in theoretical physics. This means that its readers are expected to have solid background in theoretical physics at least at the level of the L L course. No prior knowledge of specialized mathematics is required. All needed new mathematics is given in the context of discussed physical problems. As in the L L course some problems exercises are formulated along the way and again as in the L L course these are always supplemented by either solutions or by hints with exact references. Unlike the L L course though some definitions theorems and remarks are also presented. This is done with the purpose of stimulating the interest of our readers in deeper study of subject matters discussed in the text. *Algebraic Geometry and Geometric Modeling* Mohamed

Elkadi, Bernard Mourrain, Ragni Piene, 2006-11-02 Algebraic Geometry provides an impressive theory targeting the understanding of geometric objects defined algebraically. Geometric Modeling uses every day in order to solve practical and difficult problems digital shapes based on algebraic models. In this book we have collected articles bridging these two areas. The confrontation of the different points of view results in a better analysis of what the key challenges are and how they can be met. We focus on the following important classes of problems implicitization classification and intersection. The combination of illustrative pictures explicit computations and review articles will help the reader to handle these subjects.

Advances In Differential Geometry And Topology Franco Tricerri, 1990-11-20 The aim of this volume is to offer a set of high quality contributions on recent advances in Differential Geometry and Topology with some emphasis on their application in physics. A broad range of themes is covered including convex sets Kaehler manifolds and moment map.
