Gel Chemistry Jianyong Zhang, Ya Hu, Yongguang Li, 2018-01-10 This book covers various molecular metal organic dynamic covalent polymer and other gels focusing on their driving interactions structures and properties It consists of six chapters demonstrating interesting examples of these gels classified by the type of driving

interaction and also discusses the effect of these interactions on the gels structures and properties The book offers an interesting and useful guide for a broad readership in various fields of chemical and materials science *Enamel Research: Mechanisms and Characterization* Bernhard Ganss, Megan Pugach, 2016-11-23 The rodent incisor is a good model system to study the molecular and cellular events that are involved in enamel biomineralization Incisors in rodents continuously erupt during their lifespan thus allowing the study of all stages of enamel synthesis deposition mineralization and maturation in the same tissue section This model system has provided invaluable insight into the specifics of enamel formation as a basis to understand human pathologies such as amelogenesis imperfect Furthermore the rodent incisor allows exploration and understanding of some of the most fundamental mechanisms that govern biomineralization Enamel is the most mineralized hardest tissue in the body It is formed within a unique organic matrix that unlike other hard tissues such as bone and dentin does not contain collagen The formation of enamel can be divided into two main stages the secretory and maturation stage During the secretory stage a highly ordered arrangement of hydroxyapatite crystals is formed under the influence of structural matrix proteins such as amelogenin ameloblastin and enamelin During the maturation stage the organic matrix is removed and hydroxyapatite crystals expand to ultimately yield a functional hard structure consisting of over 96% mineral Research efforts over the past decades have mainly focused on the secretory stage providing novel insights into the concept of biomineralization However the events that occur during the maturation stage have not been yet explored in detail likely because the physiological roles of the enamel forming ameloblasts are more diverse and complex at this stage Mature ameloblasts are involved in the regulation of calcium transport in large amounts phosphate and protein fragments in and out of the maturing enamel and provide regulatory mechanisms for the control of the pH In recent years increased efforts have been dedicated towards defining the molecular events during enamel maturation The development of an ever increasing number of transgenic animal models has clearly demonstrated the essential roles of matrix and non matrix proteins during enamel formation Multiple traditional and modern analytical techniques are applied for the characterization of enamel in these animals The need for this Research Topic therefore stems from new information that has been generated on molecular events during the enamel maturation stage and the development and application of highly advanced analytical techniques to characterize dental enamel The benefits and limitations of these techniques need to be reviewed and their application standardized for valid comparative studies **Gregory S. Ezra** Srihari Keshavamurthy, Stephen Wiggins, 2015-06-01 In this Festschrift dedicated to the 60th birthday of Gregory S Ezra selected researchers in theoretical chemistry present research highlights on major developments in the field Originally published in the journal Theoretical Chemistry Accounts these outstanding contributions are now available in a hardcover print format as well as a special electronic edition This volume provides valuable content for all researchers in theoretical chemistry and will especially benefit those research groups and libraries with limited access to the journal Nature-Inspired Computing Nazmul H. Recent Advances in NGF and Related Molecules Laura Calzà, Luigi Aloe, Luciana Giardino, 2021-08-27
More than fifty years after its initial discovery by Rita Levi Montalcini and Stanley Cohen and the proposal of the neurotrophic theory nerve growth factor NGF has become the prototype of a family of biologically active molecules called neurotrophic factors NTFs. This book addresses important advances in NTF research from basic science to clinical medicine. It focuses mainly on NGF but also includes individual chapters dealing with the brain derived neurotrophic factor BDNF and ligands of the glial cell line derived neurotrophic factor GDNF family which have attracted increasing interest in the neuroscience community because of their diverse effects in the normal and diseased brain. In the first part of the book the authors provide the necessary background for the following chapters and discuss the basic mechanisms and pathways of NGF signal transduction. In the following sections they then examine the regenerative activity and neuroprotective capacity of NGF during development and in normal and diseased tissues in adulthood and discuss the role of NGF in Alzheimer's disease and nociception. In addition the role of NGF in processing sensory information and its influence on behavior is further discussed. The book concludes with an overview of the diagnostic and therapeutic potential of NTF in psychiatric disorders and obesity management as well as a highlight of NGF research in veterinary medicine. Many of the authors of this volume participated in the Second International Rita Levi Montalcini Meeting held in Bologna Italy in 2019. The book covers a wide range of important topics in past and current NTF research and will appeal to basic researchers and clinicians alike.

When Chemistry Meets Biology - Generating Innovative Concepts, Methods and Tools for Scientific Discovery in the Plant Sciences Erich Kombrink, Markus Kaiser, 2016-08-12 Biologically active small molecules have increasingly been applied in plant biology to dissect and understand biological systems This is evident from the frequent use of potent and selective inhibitors of enzymes or other biological processes such as transcription translation or protein degradation In contrast to animal systems which are nurtured from drug research the systematic development of novel bioactive small molecules as research tools for plant systems is a largely underexplored research area This is surprising since bioactive small molecules bear great potential for generating new powerful tools for dissecting diverse biological processes In particular when small molecules are integrated into genetic strategies thereby defining chemical genetics they may help to circumvent inherent problems of classical forward genetics There are now clear examples of important fundamental discoveries originating from plant chemical genetics that demonstrate the power but not yet fully exploited potential of this experimental approach These include the unraveling of molecular mechanisms and critical steps in hormone signaling activation of defense reactions and dynamic intracellular processes The intention of this Research Topic of Frontiers in Plant Physiology is to summarize the current status of research at the interface between chemistry and biology and to identify future research challenges The research

topic covers diverse aspects of plant chemical biology including the identification of bioactive small molecules through screening processes from chemical libraries and natural sources which rely on robust and quantitative high throughput bioassays the critical evaluation and characterization of the compound s activity selectivity and ultimately the identification of its protein target s and mode of action which is yet the biggest challenge of all Such well characterized selective chemicals are attractive tools for basic research allowing the functional dissection of plant signaling processes or for applied purposes if designed for protection of crop plants from disease New methods and data mining tools for assessing the bioactivity profile of compounds exploring the chemical space for structure function relationships and comprehensive chemical fingerprinting metabolomics are also important strategies in plant chemical biology In addition there is a continuing need for diverse target specific bioprobes that help profiling enzymatic activities or selectively label protein complexes or cellular compartments To achieve these goals and to add suitable probes and methods to the experimental toolbox plant biologists need to closely cooperate with synthetic chemists The development of such tailored chemicals that beyond application in basic research can modify traits of crop plants or target specific classes of weeds or pests by collaboration of applied and academic research groups may provide a bright future for plant chemical biology The current Research Topic covers the breadth of the field by presenting original research articles methods papers reviews perspectives and opinions
