Wind Turbine Aerodynamics and Vorticity-Based Methods Emmanuel Branlard,2017-04-05 The book introduces the fundamentals of fluid mechanics momentum theories vortex theories and vortex methods necessary for the study of rotors aerodynamics and wind turbines aerodynamics in particular Rotor theories are presented in a great level of details at the beginning of the book These theories include the blade element theory the Kutta Joukowski theory the momentum theory and the blade element momentum method A part of the book is dedicated to the description and implementation of vortex methods The remaining of the book focuses on the study of wind turbine aerodynamics using vortex theory analyses or vortex methods Examples of vortex theory applications are optimal rotor design tip loss corrections yaw models and dynamic inflow models Historical derivations and recent extensions of the models are presented The cylindrical vortex model is another example of a simple analytical vortex model presented in this book This model leads to the development of different BEM models and it is also used to provide the analytical velocity field upstream of a turbine or a wind farm under aligned or yawed conditions Different applications of numerical vortex methods are presented Numerical methods are used for instance to investigate the influence of a wind turbine on the incoming turbulence Sheared inflows and aero elastic simulations are investigated using vortex methods for the first time Many analytical flows are derived in details vortex rings vortex cylinders Hill s vortex vortex blobs etc They are used throughout the book to devise simple rotor models or to validate the implementation of numerical methods Several Matlab programs are provided to ease some of the most complex implementations

South Africa's water governance hydraulic mission (1912-2008) in a WEF-Nexus context Johann W.N. Tempelhoff,2018-12-01 Geologists physicists and ecologists currently promote the idea of a post Holocene epoch the Anthropocene As a result of constant innovation and modernisation in the fields of engineering

natural science management studies and environmental studies there has been a growing awareness of the intrinsic interaction between humankind and the environment. Humankind has become part of the environmental dynamics to the extent that they are literally able to change ecosystems. Nowhere is the impact more evident than in the anthropogenic engagement with the hydrosphere from the smallest pool of water to the earth's atmosphere. Comprehensive infrastructure development in water and sanitation, the growing trend to seek additional resources in the form of groundwater, desalinated seawater and recycled wastewater as well as special attention being given to capturing and preserving rainwater bear evidence of a timely response to climate change, population growth and rapid development in many water stressed regions of the world. The purpose of the book is to provide a historical overview of the manner in which South Africa's water resources have been governed from a time when the Union of South Africa was formed in 1910 up to 2008, a time of a growing global awareness of the potential impact that climate change may have on water resources in a key region of southern Africa, notable for increasing levels of aridity and more erratic rainfall patterns. This focus on the history of water affairs in South Africa makes it possible for scholars to comprehend the contemporary transitions made in the country's water governance system since the establishment in 2014 of the Department of Water and Sanitation. The focus is on the Water-Energy-Food nexus, a strategy which holistically contemplates the governance and use of water from the perspective of the interconnection between water, energy and food as resources.
