Gene Therapy for the Central and Peripheral Nervous System Andrew P. Tosolini, George M. Smith, 2018-05-10 Gene therapy is at the forefront of current techniques that aim to re establish functional connectivity after an insult to the brain spinal cord or peripheral nerves Gene therapy makes the most of the existing cellular machinery and anatomical networks to facilitate molecular changes in DNA RNA and proteins aiming to repair these disrupted connections For instance gene therapy is currently being used to target genes in conditions including spinal cord injury amyotrophic lateral sclerosis spinal muscular atrophy stroke and multiple sclerosis amongst others The various delivery routes include viral vectors genetically modified cellular implants naked DNA RNA liposomes Cre LoX recombination optogenetics and nanoparticles In particular gene therapy aims to restore function by augmenting the expression of neuroprotective axonal growth promoting neurotrophic factors e g BDNF CNTF NGF and GDNF etc Furthermore the downstream intracellular signalling pathways after receptor activation can also be targeted e g mTOR MAPK etc On the other hand gene therapy can also be used to downregulate and or remove faulty mutated genes such

as those contributing to disease progression or that inhibit axonal regeneration e.g. SOD 1, TDP 43, Nogo A, MAG, Omp, etc. Depending on the methodology these genes for instance can be silenced, removed or replaced to alleviate the underlying pathology. As such, gene therapy can transform a largely toxic and inhibitory milieu surrounding a neuronal axonal insult into a growth permissive environment that will ultimately aid neuronal survival and functional regeneration. Moreover, gene therapy has the capacity to target non-neuronal cells and can be even used for neuroanatomical tract tracing. Ultimately, the principal outcome of gene therapy is to functionally restore damaged neuronal and/or axonal connections irrespective of the system it is being introduced in to. This Research Topic is devoted to work using gene therapy for the both the central and/or peripheral nervous system.

Synchrotron Radiation in Structural Biology R. Sweet, 2013-03-09. The development of synchrotron radiation (SR) as a research tool was driven largely by the needs of materials scientists and solid state physicists. However, the availability of SR has extended significantly the capability of scientists who study biological structure with radiation. This volume contains some of the results reported at a symposium held at Brookhaven National Laboratory in May 1988 to discuss the application of synchrotron radiation to structural biology. We are grateful for financial support from the U.S. Department of Energy, the National Institutes of Health, Genentech Inc., Blake Industries Inc., Evans and Sutherland Co., The Upjohn Company, Eli Lilly and Company, Enraf Nonius Service Corp. and Associated Universities Inc.
