M. de Oliveira, Ji Liu, Esther

Pacitti, 2022-06-01 Workflows may be defined as abstractions used to model the coherent flow of activities in the context of an in silico scientific experiment They are employed in many domains of science such as bioinformatics astronomy and engineering Such workflows usually present a considerable number of activities and activations i e tasks associated with activities and may need a long time for execution Due to the continuous need to store and process data efficiently making them data intensive workflows high performance computing environments allied to parallelization techniques are used to run these workflows At the beginning of the 2010s cloud technologies emerged as a promising environment to run scientific

workflows By using clouds scientists have expanded beyond single parallel computers to hundreds or even thousands of virtual machines More recently Data Intensive Scalable Computing DISC frameworks e g Apache Spark and Hadoop and environments emerged and are being used to execute data intensive workflows DISC environments are composed of processors and disks in large commodity computing clusters connected using high speed communications switches and networks The main advantage of DISC frameworks is that they support and grant efficient in memory data management for large scale applications such as data intensive workflows However the execution of workflows in cloud and DISC environments raise many challenges such as scheduling workflow activities and activations managing produced data collecting provenance data etc Several existing approaches deal with the challenges mentioned earlier This way there is a real need for understanding how to manage these workflows and various big data platforms that have been developed and introduced As such this book can help researchers understand how linking workflow management with Data Intensive Scalable Computing can help in understanding and analyzing scientific big data In this book we aim to identify and distill the body of work on workflow management in clouds and DISC environments We start by discussing the basic principles of data intensive scientific workflows Next we present two workflows that are executed in a single site and multi site clouds taking advantage of provenance Afterward we go towards workflow management in DISC environments and we present in detail solutions that enable the optimized execution of the workflow using frameworks such as Apache Spark and its extensions

The African Continental Free Trade Agreement: Welfare Gains Estimates from a General Equilibrium Model Mr.Lisandro Abrego,Maria Alejandra Amado,Tunc Gursoy,Garth P. Nicholls,Hector Perez-Saiz,2019-06-07 In March 2018 representatives of member countries of the African Union signed the African Continental Free Trade Area AfCFTA agreement This agreement provides a framework for trade liberalization in goods and services and is expected to eventually cover all African countries Using a multi country multi sector general equilibrium model based on Costinot and Rodriguez Clare 2014 we estimate the welfare effects of the AfCFTA for 45 countries in Africa Three different model specifications comprising both perfect competition and monopolistic competition are used Simulations

include full elimination of import tariffs and partial but substantial reduction in non tariff barriers NTBs Results reveal significant potential welfare gains from trade liberalization in Africa As intra regional import tariffs in the continent are already low the bulk of these gains come from lowering NTBs Overall gains for the continent are broadly similar under the three model specifications used with considerable variation of potential welfare gains across countries in all model structures
