Liou, Mark Cloos, Wallace Gary Ernst, 2006 *Genetic Management of Fragmented Animal and Plant Populations* Richard Frankham, Jonathan D. Ballou, Katherine Ralls, Mark Derek Bruce Eldridge, Michele R. Dudash, Charles Barnet Fenster, Robert Cady Lacy, Paul Sunnucks, 2017 One of the greatest unmet challenges in conservation biology is the genetic management of fragmented populations of threatened animal and plant species More than a million small isolated population fragments of threatened species are likely suffering inbreeding depression and loss of evolutionary potential resulting in elevated extinction risks Although these effects can often be reversed by re establishing gene flow between population fragments managers very rarely do this On the contrary genetic methods are used mainly to document genetic differentiation among populations with most studies concluding that genetically differentiated populations should be managed separately thereby isolating them yet further and dooming many to eventual extinction Many small population fragments are going extinct principally for genetic reasons Although the rapidly advancing field of molecular genetics is continually providing new tools to measure the extent of population fragmentation and its genetic consequences adequate guidance on how to use these data for effective conservation is still lacking This accessible authoritative text is aimed at senior undergraduate and graduate students interested in conservation biology conservation genetics and wildlife management It will also be of particular relevance to conservation practitioners and natural resource managers as well as a broader academic audience of conservation biologists and evolutionary ecologists

Rutenbar, 2010-09-09 Knowledge exists you only have to find it VLSI design has come to an important inflection point with the appearance of large manufacturing variations as semiconductor technology has moved to 45 nm feature sizes and below If we ignore the random variations in the manufacturing process simulation based design essentially becomes useless since its predictions will be far from the reality of manufactured ICs On the other hand using design margins based on some traditional notion of worst case scenarios can force us to sacrifice too much in terms of power consumption or manufacturing cost to the extent of making the design goals even infeasible We absolutely need to explicitly account for the statistics of this random variability to have design margins that are accurate so that we can find the optimum balance between yield loss and design cost This discontinuity in design processes has led many researchers to develop effective methods of statistical design where the designer can simulate not just the behavior of the nominal design but the expected statistics of the behavior in manufactured ICs Memory circuits tend to be the hardest hit by the problem of these random variations because of their high replication count on any single chip which demands a very high statistical quality from the product Requirements of 5 6s 0 *BNA's Patent, Trademark & Copyright Journal* ,2003-05 Temel Kadın Hastalıkları ve Doğum Bilgisi İ.
