## Section 1: Energy Flow in Ecosystems

**Physical fitness measurements** Endurance, speed, acceleration, and anaerobic power were measured using a 100-m sprint, 100-m acceleration, 100-m endurance, and 100-m anaerobic power test.

Energy from the sun enters an ecosystem when a plant uses sunlight to make sugar molecules by a process called photosynthesis. During photosynthesis, plants, algae, and some bacteria capture solar energy. Solar energy drives a series of chemical reactions that require carbon dioxide and water. The result of photosynthesis is the production of sugar molecules known as carbohydrates. Carbohydrates are energy-rich molecules which organisms use to carry out daily activities. As organisms consume other plants or animals, energy is transferred from one organism to another. Plants produce carbohydrates in their leaves. When an animal eats a plant, some energy is transferred from the plant to the animal. Organisms use this energy to move, grow, and reproduce.

## IDENTIFYING MAIN IDEAS
