### 6.3 SECTION: GRASSLAND, DESERT, AND TUNDRA BIOMES

Read the passage below and answer the questions that follow.

All desert plants have adaptations for obtaining and conserving water, which allows the plants to live in dry, desert conditions. Plants called succulents, such as cactuses, have thick, fleshy stems and leaves that store water. Their leaves also have a waxy coating that prevents water loss. Sharp spines on cactuses keep thirsty animals from devouring the plant's juicy flesh. Rainfall rarely penetrates deeply into the soil, so many plants' roots spread out just under the surface of the soil to absorb as much rain as possible.

Instead of living in dry conditions, some desert plants are adapted to survive for long periods of time without water. When conditions are too dry, some plants die and drop seeds that stay dormant in the soil until the next rainfall. Then, new plants quickly germinate, grow, and bloom before the soil becomes dry again. Some desert plants have adapted so that they can survive even if their water content drops to as low as 50 percent of their mass. Water levels below 50 to 75 percent are fatal for most plants.
