,2020-07-22 Materials in a nuclear environment are exposed to extreme conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material behavior very different from conventional materials This is evident for the four major technological challenges the nuclear technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their behavior in order to assess their performance and to determine the limits of operation Comprehensive Nuclear Materials Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The articles are written at a level that allows undergraduate students to understand the material while providing active researchers with a ready reference resource of information Most of the chapters from the first Edition have been revised and updated and a significant number of new topics are covered in completely new material During the ten years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world events public awareness and technological innovation Materials play a key role as enablers of new technologies and we trust that this new edition of Comprehensive Nuclear Materials has captured the key recent developments Critically reviews the major classes and functions of materials supporting the selection assessment validation and engineering of materials in extreme nuclear environments Comprehensive resource for up to date and authoritative information which is not always available elsewhere even in journals Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues Serves as an excellent entry point for students and researchers new to the field

Antimicrobial Peptides: Utility Players in Innate Immunity Mark W. Robinson, Andrew T. Hutchinson, Sheila Donnelly, Antimicrobial peptides AMPs represent an ancient group of molecules with diverse functions in innate immunity To date more than 1000 naturally occurring AMPs have been identified which display considerable diversity in their primary sequences lengths structures and biological activities Despite this variability AMPs are broadly classified according to homologous secondary structures as cathelicidins linear a helical peptides defensins strand peptides connected by disulfide bonds and bactenecins loop peptides Most but not all AMPs are cationic with amphipathic faces These biochemical properties bestow many peptides with potent antimicrobial activity by facilitating interactions with negatively charged microbial cell membrane components thereby increasing membrane permeability and resulting in microbial death Other indirect effects on microbial physiology have been reported including inhibition of DNA RNA synthesis impaired protein synthesis and folding disruption of cell wall formation and inhibition of microbial cell metabolism Thus with the

spread of antibiotic resistant microbial pathogens AMPs have emerged as exciting candidates for next generation anti infective therapies However recent studies suggest that AMPs have evolved other mechanisms of pathogen clearance Immunomodulation is a novel approach to antimicrobial therapy that centres on boosting host immunity rather than direct microbial killing This is also an attractive means to treat sepsis and other immune mediated diseases Whilst several cationic peptides are under investigation as antimicrobial agents a select few show a remarkable ability to protect against lethal endotoxaemia and clinically relevant bacterial infections including methicillin resistant Staphylococcus aureus MRSA The molecular mechanisms responsible for this protection are only beginning to emerge but include prevention of innate cell activation by targeting key stages of bacterial endotoxin mediated cell signalling In this research topic hosted by Frontiers in Molecular Innate Immunity we aim to highlight key areas of AMP research including peptide diversity structure function relationships antimicrobial activity and mechanisms of immune modulation We also aim to stimulate discussion on the emerging therapeutic potential of AMPs including antifungal antiviral and anticancer applications
