Abstract

In this paper, we report some findings of a study on attitude and mathematics achievement at the senior secondary school level in Botswana. We adopted a new methodology in the analysis of the relationship between attitude, gender bias and achievement in mathematics with gender as a dummy variable. The method, quantile regression (QReg), was used because it unveils the relationship at the quantile (percentile) levels and does not require the parametric assumptions used in the Ordinary Least Square Regression (OLS). The findings showed that positive attitude significantly influenced the mathematics achievement of students in the OLS model but was not significant at the 95th percentile in the QReg. These findings implied that at the uppermost tail of mathematics achievements, there were some other variables that better explained mathematics achievements. Furthermore, using this method, gender bias and female factors did not influence achievements significantly. Finally, we hope that this study would open up a new research frontier by encouraging researchers to study the mathematics achievement-attitude relationship at the quantiles rather than generalizing the relationship across all levels of students' ability.

Keywords: Mathematics attitudes, achievement, gender, quantile regression.

Background of the Study

The relationship between attitudes and mathematics performance has been of interest to researchers for many years (Aiken, 1970; Chionh & Fraser, 2009; Yara, 2009a,b; Forgasz & Rivera, 2012). Mathematics subject is failed by many learners around the world and mathematics educators have been of the view that poor attitudes towards the subject could be contributing to low achievement. A number of studies have indicated significant relationships between mathematics achievement and attitudes (Aiken, 1970; Masquand, 1992; Ma, 1997; Sherman & Christian 1999; Sriraman, 2007; Yara, 2009a,b; Forgasz 2012). The findings of these studies have raised interest for further research and deeper understanding of the relationship between achievement, attitudes and other related parameters. However, the use of classical statistical techniques in the analysis of the achievement-attitude relationship, like the Ordinary Least Square (OLS) regression have, focused mainly on the conditional
