

Chapter 8 Introduction to Membranes:

- What is this structure? We can see a vacuole that's been labeled in red at the merged when tagged with FM. Now, what type of cells have vacuoles? Well, plant cells, however this is single celled and circular. This is a yeast cell.
- They have vacuoles labeled with one color. The image represents distinct membranes within the cytoplasm. What's being represented is the ER (the other organelle) and the vacuole. What we're seeing is that the ER and vacuole may be interacting with one another, however they are distinct.
- HDEL: Protein that localizes to the ER and the Golgi. (GFP = GREEN FLUORESCENT PROTEIN).
- FM: Protein that localizes to the vacuole.

How do cells use lipids?

- They construct membranes out of them, gather energy out of them, and use them for signaling.
- Membranes (Fatty acids, cholesterol for tight packing of the membrane.)
- Energy that feeds into the TCA. (Also, fatty acids.)
- Signaling (through steroids).

The fluid mosaic:

- Membranes enclose most organelles and the cell itself and acts as a selective barrier.
- Cell membranes are dynamic, fluid structures and most of their molecules move about in the plane of membrane.
- All these molecules can move around in the membrane, they're not restricted in their ability to diffuse in this structure.
- What holds the lipid bilayer together? Hydrophobic interactions.

Mouse Models of Developmental Genetic Disease, 2011-09-06 Approximately three percent of newborn humans have congenital anomalies with significant cosmetic and/or functional consequences. Much of our ability to understand what has gone awry in these birth defects rests with development of animal models for them; the mouse has emerged as the model organism of choice for these studies. This volume reviews mouse models of specific developmental genetic diseases including neural tube defects, cleft lip and/or palate, congenital heart disease, ciliopathies, hereditary deafness, and others, to provide conceptual insight into congenital anomalies generally. The interplay between clinical observation and murine model systems is expected to yield deep insight into mammalian developmental processes and the emergence of effective preventive and/or therapeutic strategies. Provides busy clinical and basic science researchers a one stop overview and synthesis of the latest research findings and contemporary thought in the area. Allows researchers to compare and contrast disease models and also to learn about what models have been developed for large scale distribution. Allows researchers to evaluate basic differences in mouse and human biology and propose alternate pathways and possible gene interactions of the disease.

Autophagy in Infection and Immunity Beth Levine, Tamotsu Yoshimori, Vojo Deretic, 2009-10-03 Autophagy is a fundamental biological process that enables cells to autodigest their own cytosol during starvation and other forms of stress. It has a growing spectrum of acknowledged roles in immunity, aging, development, neurodegeneration, and cancer biology. An immunological role of autophagy was first recognized with the discovery of autophagy's ability to sanitize the cellular interior by killing intracellular microbes. Since then, the repertoire of autophagy's roles in immunity has been vastly expanded to include a diverse but interconnected portfolio of regulatory and effector functions. Autophagy is an effector of Th1/Th2 polarization; it fuels MHC II presentation of cytosolic self and microbial antigens; it shapes central tolerance; it affects B and T cell homeostasis; it acts both as an effector and a regulator of Toll-like receptor and other innate immunity receptor signaling; and it may help ward off chronic inflammatory

disease in humans With such a multitude of innate and adaptive immunity functions the study of autophagy in immunity is one of the most rapidly growing fields of contemporary immunological research This book introduces the reader to the fundamentals of autophagy guides a novice and the well informed reader alike through different immunological aspects of autophagy as well as the countermeasures used by highly adapted pathogens to fight autophagy and provides the expert with the latest up to date information on the specifics of the leading edge of autophagy research in infection and immunity
