Integrated Model of Distributed Systems Wiktor B. Daszczuk, 2019-03-16 In modern distributed systems such as the Internet of Things or cloud computing verifying their correctness is an essential aspect This requires modeling approaches that reflect the natural characteristics of such systems the locality of their components autonomy of their decisions and their asynchronous communication However most of the available verifiers are unrealistic because one or more of these features are not reflected Accordingly in this book we present an original formalism the Integrated Distributed Systems Model IMDS which defines a system as two sets states and messages and a relation of the actions between these sets The server view and the traveling agent s view of the system provide communication duality while general temporal formulas for the IMDS allow automatic verification The features that the model checks include partial deadlock and partial termination communication deadlock and resource deadlock Automatic verification can support the rapid development of distributed systems Further on the basis of the IMDS the Dedan tool for automatic verification of distributed systems has been developed
