Integration of Distributed Resources in Smart Grids for Demand Response and Transactive Energy Meng Song,Ciwei Gao,2021-11-30 The proliferation of renewable energy enhances the sustainability of power systems but the inherent variability also poses great challenges to the planning and operation of large power grids The corresponding electric power deficiencies can be compensated by fast ramping generators and energy storage devices However frequent ramp up down power adjustments can increase the operation and the maintenance cost of generators Moreover storage devices are regarded as costly alternatives Demand response DR and transactive energy can address this problem owing to its attractive and versatile capability for balancing the supply demand improving energy efficiency and enhancing system resilience Distributed resources are the typical participants of DR and transactive energy programs which greatly contribute to keep the supply and demand in a balance Thermostatically controlled loads TCLs i e air conditioners water heaters and refrigerators represent an example of distributed resources the ratio of which to the total power consumption in developed countries is up to 30% 40% Providing tremendous potentials in adjustable power consumption TCLs have attracted major interests in DR and transactive energy opportunities It has highlighted the advantages of TCLs in responding to uncertainties in power systems This book provides an insight of TCLs as typical distributed resources in smart grids for demand response and transactive energy to address the imbalance between supply and demand problems in power systems The key points on analysis of uncertainty parameters aggregated control models battery modelling multi time scale control transactive control and robust restoration of TCLs are all included These are the research points of smart grids and deserve much attention We believe this book will offer the related researcher a better understanding on the integration of distributed resources into smart grid for demand response and transactive energy And it will be helpful to address the problems in practical projects

Ecohydrology of the Andes Páramo Region Veronica G. Minaya Maldonado,2017-07-14 In the Andes mountainous region of South America grasslands known as p ramos provide important ecosystem services like sustaining biodiversity securing carbon sequestration and providing water storage However many p ramos regions are subject to land use change due to expanding agriculture intensified grazing and land burning These are usually caused by socio economic factors driving local communities to increase their income generation Trying to achieve a better understanding of the p ramos is often restricted to exploring specific details and does not follow an

integrated approach or a comprehensive ecosystem analysis In this research the focus is on better understanding the dominant ecohydrological processes and their interactions An integrated approach is followed using in situ measurements field experiments laboratory analyses and numerical modelling Also different hydroinformatics tools are used to identify and quantify the ecosystem services provided by the p ramos Moreover a framework is developed that allows a more realistic quantification and mapping of the main ecosystem services The approach was carried out for a test site in an Ecological area in North Ecuador The findings show a clear difference in ecosystem services depending on their altitudinal range and type of vegetation These results can be used to further develop environmental management and landscape planning strategies in order to better meet the social goals This research is aligned with the priorities advocated in the IPCC Report 2007 to improve representation of the interactive coupling between ecosystems and the climate system and with SDG 15 Life on Land By 2020 ensure the conservation restoration and sustainable use of terrestrial and inland freshwater ecosystems and their services
