7 Form G Geomeryy:

Connections Between Algebra, Combinatorics, and Geometry Susan M. Cooper, Sean Sather-Wagstaff, 2014-05-16
Commutative algebra combinatorics and algebraic geometry are thriving areas of mathematical research with a rich history of interaction. *Connections Between Algebra and Geometry* contains lecture notes along with exercises and solutions from the Workshop on Connections Between Algebra and Geometry held at the University of Regina from May 29 to June 1, 2012. It also contains research and survey papers from academics invited to participate in the companion Special Session on Interactions Between Algebraic Geometry and Commutative Algebra which was part of the CMS Summer Meeting at the University of Regina held June 2-3, 2012, and the meeting Further Connections Between Algebra and Geometry which was held at the North Dakota State University February 23, 2013. This volume highlights three mini courses in the areas of commutative algebra and algebraic geometry: differential graded commutative algebra, secant varieties and fat points, and symbolic powers. It will serve as a useful resource for graduate students and researchers who wish to expand their knowledge of commutative algebra, algebraic geometry, combinatorics, and the intricacies of their intersection.

An Introduction to the Geometry of Numbers
J.W.S. Cassels, 2012-12-06
From the reviews: The work is carefully written. It is well motivated and interesting to read even if it is not always easy. Historical material is included; the author has written an excellent account of an interesting subject. *Mathematical Gazette*: A well-written, very thorough account. Among the topics are lattices, reduction, Minkowski's Theorem, distance functions, packings, and automorphisms, some applications to number theory, excellent bibliographical references. *The American Mathematical Monthly*.

Conformal Differential Geometry and Its Generalizations Maks A. Akiyis, Vladislav V. Goldberg, 1996-09-06
Comprehensive coverage of the foundations, applications, recent developments, and future of conformal differential geometry. *Conformal Differential Geometry and Its Generalizations* is the first and only text that systematically presents the foundations and manifestations of conformal differential geometry. It offers the first unified presentation of the subject which was established more than a century ago. The text is divided into seven chapters, each containing figures, formulas, and historical and bibliographical notes, while numerous examples elucidate the necessary theory. Clear, focused, and expertly synthesized. *Conformal Differential Geometry and Its Generalizations* develops the theory of hypersurfaces and submanifolds of any dimension of conformal and pseudoconformal spaces. Investigates conformal and pseudoconformal structures on a manifold of arbitrary dimension, derives their structure equations, and explores their tensor of conformal curvature. Analyzes the real theory of four-dimensional conformal structures of all possible signatures. Considers the analytic and differential geometry of Grassmann and almost Grassmann structures. Draws connections between almost Grassmann structures and web theory. Conformal differential geometry, a part of classical differential geometry, was founded at the turn of the century and gave rise to the study of conformal and almost Grassmann structures in later years. Until now, no book has offered a systematic presentation of the multidimensional conformal differential geometry and the conformal and

almost Grassmann structures After years of intense research at their respective universities and at the Soviet School of Differential Geometry Maks A Akivis and Vladislav V Goldberg have written this well conceived expertly executed volume to fill a void in the literature Dr Akivis and Dr Goldberg supply a deep foundation applications numerous examples and recent developments in the field Many of the findings that fill these pages are published here for the first time and previously published results are reexamined in a unified context The geometry and theory of conformal and pseudoconformal spaces of arbitrary dimension as well as the theory of Grassmann and almost Grassmann structures are discussed and analyzed in detail The topics covered not only advance the subject itself but pose important questions for future investigations This exhaustive groundbreaking text combines the classical results and recent developments and findings This volume is intended for graduate students and researchers of differential geometry It can be especially useful to those students and researchers who are interested in conformal and Grassmann differential geometry and their applications to theoretical physics

Computational Arithmetic Geometry Kristin Estella Lauter, 2008 With the recent increase in available computing power new computations are possible in many areas of arithmetic geometry To name just a few examples Cremona's tables of elliptic curves now go up to conductor 120 000 instead of just conductor 1 000 tables of Hilbert class fields are known for discriminant up to at least 5 000 and special values of Hilbert and Siegel modular forms can be calculated to extremely high precision In many cases these experimental capabilities have led to new observations and ideas for progress in the field They have also led to natural algorithmic questions on the feasibility and efficiency of many computations especially for the purpose of applications in cryptography The AMS Special Session on Computational Arithmetic Geometry held on April 29-30 2006 in San Francisco CA gathered together many of the people currently working on the computational and algorithmic aspects of arithmetic geometry This volume contains research articles related to talks given at the session The majority of articles are devoted to various aspects of arithmetic geometry mainly with a computational approach

Classical Function Theory, Operator Dilation Theory, and Machine Computation on Multiply-Connected Domains Jim Agler, John Harland, Benjamin J. Raphael, 2008 This work begins with the presentation of generalizations of the classical Herglotz Representation Theorem for holomorphic functions

with positive real part on the unit disc to functions with positive real part defined on multiply connected domains The generalized Herglotz kernels that appear in these representation theorems are then exploited to evolve new conditions for spectral set and rational dilation conditions over multiply connected domains These conditions form the basis for the theoretical development of a computational procedure for probing a well known unsolved problem in operator theory the so called rational dilation conjecture Arbitrary precision algorithms for computing the Herglotz kernels on circled domains are presented and analyzed These algorithms permit an effective implementation of the computational procedure which results in a machine generated counterexample to the rational dilation conjecture
