This Systems Thinking Special Issue contains 12 papers on the nature of systems thinking as it applies to systems engineering systems science system dynamics and related fields Systems thinking can be broadly considered the activity of thinking applied in a systems context forming a basis for fundamental approaches to several systems disciplines including systems engineering systems science and system dynamics Although these are somewhat distinct fields they are bound by common approaches in regard to systems Whereas systems engineering seeks to apply a multidisciplinary holistic approach to the development of systems systems science seeks to understand the basics related to systems of all kinds from natural to man made and system dynamics seeks to understand system structures in order to influence its dynamics Man made systems have become more ubiquitous and complex The study of systems both natural and engineered presents new challenges and opportunities to understand emergent dynamic behaviors that inform the process of sense making based on systems thinking

**Whole System Design** Peter Stasinopoulos, Michael H. Smith, Karlson Hargroves, Cheryl Desha, 2013-01-11 Whole System Design is increasingly being seen as one of the most cost effective ways to both increase the productivity and reduce the negative environmental impacts of an engineered system A focus on design is critical as the output from this stage of the project locks in most of the economic and environmental performance of the designed system throughout its life which can span from a few years to many decades Indeed it is now widely acknowledged that all designers particularly engineers architects and industrial designers need to be able to understand and implement a whole system design approach This book provides a clear design methodology based on leading efforts in the field and is supported by worked examples that demonstrate how advances in energy materials and water productivity can be achieved through applying an integrated approach to sustainable engineering Chapters 1 5 outline the approach and explain how it can be implemented to enhance the established Systems Engineering framework Chapters 6 10 demonstrate through detailed worked examples the application of the approach to industrial pumping systems passenger vehicles electronics and computer systems temperature

*Service Orientation in Holonic and Multi Agent Manufacturing and Robotics* Theodor Borangiu, Andre Thomas, Damien Trentesaux, 2013-02-15. The book covers four research domains representing a trend for modern manufacturing control: Holonic and Multi agent technologies for industrial systems; Intelligent Product and Product driven Automation; Service Orientation of Enterprise's strategic and technical processes; and Distributed Intelligent Automation Systems. These evolution lines have in common concepts related to service orientation derived from the Service Oriented Architecture (SOA) paradigm. The service oriented multi agent systems approach discussed in the book is characterized by the use of a set of distributed autonomous and cooperative agents embedded in smart components that use the SOA principles being oriented by offer and request of services in order to fulfil production systems and value chain goals. A new integrated vision combining emergent technologies is offered to create control structures with distributed intelligence supporting the vertical and horizontal enterprise integration and running in truly distributed and global working environments. The service value creation model at enterprise level consists into using Service Component Architectures for business process applications based on entities which handle services. In this componentization view a service is a piece of software encapsulating the business control logic or resource functionality of an entity that exhibits an individual competence and responds to a specific request to fulfil a local product or global batch objective.
