Lecture 2

- Outline the nature of mutations
- Outline the basis for and rate of spontaneous mutation
- Outline, with examples, why most are silent or recessive
- Explain the different evolutionary histories of recessive and dominant mutations.

The nature of mutations is to change or alter the genetic material of a virus or cell. This causes a change in the sequence of Base pairs within the DNA of that organism, resulting in either a different lethal function, loss of function or an advantageous function.

The basis for a spontaneous mutation is natural errors made within the cell's DNA replication – this cause of genetic change occurs due to the absence of certain mutagens and will also have no known cause. Natural selection requires genetic differentiation, generated by sex (recombination) and by these spontaneous mutations. These mutations will have a very low mutation rate such as germline cells as well as 3 new mutations per 10^9 base pairs per generation (in 6 million base pairs which must be diploid). Spontaneous mutations are where replication error occurs as well as ionising radiation and metabolism (ROS)*

*Reactive Oxygen Species are the potential to cause cellular damage are reproduced along with the release of energy. These can damage lipids, DNA, RNA, and proteins which all relates to aging. (Net mutation)

A silent mutation is the change in 1 base pair code for the same amino acid.

- An example of a silent mutation is caused by a mutant gene which causes phenylalanine hydrolase to be less active causing too much phenylalanine. This is then broken down into phenyl pyruvic acid.

A recessive mutation is caused by too much or too little substrate and genes that make gene product.

- An example of a recessive mutation is caused by the mutant gene that codes for tyrosinase, causes it to be less active . And so not converting tyrosinase into melanin causes the albinism phenotype.

Biology Education and Research in a Changing Planet Esther Gnanamalar Sarojini Daniel, 2015-08-17 This book presents selected conference proceedings from the 25th Biennial Asian Association for Biology Education Conference. It clarifies the differences between the structure of biology education for educators and researchers. It solves open problems by creating a bridge between biological research and its application in education and the sustainable development of communities. The book's first topic is Biology Education in an X Y Z World which provides ideas for how biology can be taught in innovative ways. The second topic The Endangered Planet How can Biology Education Help discusses how humans depend on other species for survival and how they have the power to cause or to prevent extinctions. The third and final topic Research in Biology encompasses the growing wealth of biological information resulting from scientific research especially in universities. Educators can use these findings to enhance their teaching.

Interests and Epistemic Integrity in Science Jan De Winter, 2016-07-26 Scientific research is often influenced by financial interests, political interests, or personal career interests of the scientists involved. For instance, the pharmaceutical giant Merck manipulated clinical trial data in order to make sure that data confirmed the safety of one of its products Vioxx in order to serve the company's short-term commercial interests. This case is obviously unacceptable. But why exactly is it unacceptable? One way to account for this judgment is on the basis of the ideal of purity. According to this ideal, scientific decision making should be pure, that is, unaffected by financial interests, political interests, career interests, and so on. Although this ideal is questionable, many people, including philosophers of science, still hold on to it. In *Interests and Epistemic Integrity in Science: A New Framework to Assess Interest Influences in Scientific Research Processes*, Jan De Winter first argues that it is better to fully abandon the ideal of purity, then proposes an alternative ideal to assess interest influences in science: the ideal of epistemic integrity. He spells out and systematically defends a new concept of epistemic integrity, using it not only to analyze the Vioxx debacle but also to identify unacceptable interest influences in aerospace science, climate science, and biology, and to explain exactly why these interest influences are unacceptable. These analyses make a compelling case for the new concept of epistemic integrity, which will be interesting and useful for philosophers of science, scientists, engineers, science policymakers, and anyone else concerned about the integrity of science.
