Decennial Index to Chemical Abstracts ,1926

*Biochar for Environmental Management* Johannes Lehmann,Stephen Joseph,2015-02-20 Biochar is the carbon rich product which occurs when biomass such as wood manure or crop residues is heated in a closed container with little or no available air It can be used to improve agriculture and the environment in

several ways and its persistence in soil and nutrient retention properties make it an ideal soil amendment to increase crop yields. In addition to this biochar sequestration in combination with sustainable biomass production can be carbon negative and therefore used to actively remove carbon dioxide from the atmosphere with potentially major implications for mitigation of climate change. Biochar production can also be combined with bioenergy production through the use of the gases that are given off in the pyrolysis process. The first edition of this book published in 2009 was the definitive work reviewing the expanding research literature on this topic. Since then the rate of research activity has increased at least ten fold and biochar products are now commercially available as soil amendments. This second edition includes not only substantially updated chapters but also additional chapters on environmental risk assessment on new uses of biochar in composting and potting mixes, a new and controversial field of studying the effects of biochar on soil carbon cycles on traditional use with very recent discoveries that biochar was used not only in the Amazon but also in Africa and Asia on changes in water availability and soil water dynamics and on sustainability and certification. The book therefore continues to represent the most comprehensive compilation of current knowledge on all aspects of biochar.

*Reaction Dynamics Involving Ions, Radicals, Neutral and Excited Species* Stefano Falcinelli, Antonio Aguilar, Paolo Tosi, Marzio Rosi, 2020-01-22

*Triple Oxygen Isotope Geochemistry* Ilya N. Bindeman, Andreas Pack, 2021-02-22

Volume 86 of *Reviews in Mineralogy and Geochemistry* concentrates on understanding the variations among ratios of the three isotopes of oxygen with primary emphasis on terrestrial systems. Triple oxygen isotope variations may be related to large mass independent fractionation effects such as observed in the Earth atmosphere or may be small and related to minute variations due to purely mass dependent processes. Recent advancements in analytical resolution now allow for the identification of processes and distinct reservoirs that were formerly hidden in the paradigm of a single terrestrial fractionation line. New high resolution measurements are accompanied by advances in theoretical calculations that dovetail with empirical calibrations and applications throughout this volume. 14 chapters span a wide range of subjects from ab initio theoretical approaches to observation of triple oxygen isotope variations in the Earth litho, hydro, and atmosphere.
