Revised Statutes of the State of Illinois, 1921, Containing All the General Statutes of the State in Force January 1, 1922
Illinois,1922 **Revised Statutes of the State of Illinois, 1917** Illinois,1918 **Revised Statutes of the State of Illinois** Illinois,1929 *The Mutual Security Act and Overseas Private Investment* United States. Congress. House. Committee on Foreign Affairs,1953 **Callaghan's Illinois Statutes Annotated** Illinois,1924 **Annotated Statutes of the State of Illinois** Illinois,1919 The revised statutes of Ontario, 1927 ,1927 10 Sample Question Papers for CBSE Board Term 1 Class 12 Biology Career Point Kota,2021-11-17 Strictly as per the Term wise syllabus Sample Question Paper released on 2nd Sept 2021 Exam Targeted 10 Solved Papers All Types of MCQs Assertion reason Case based Answers with Explanations OMR Sheets after each Sample Question Paper Exam oriented important Questions for Board Exam **Thin metal films on weakly-interacting substrates** Andreas Jamnig,2020-09-30 Vapor based growth of thin metal films with controlled morphology on weakly interacting substrates WIS including oxides and van der Waals materials is essential for the fabrication of multifunctional metal contacts in a wide array of optoelectronic devices Achieving this entails a great challenge since weak film substrate interactions yield a pronounced and uncontrolled 3D morphology Moreover the far from equilibrium nature of vapor based film growth often leads to generation of mechanical stress which may further compromise device reliability and functionality The objectives of this thesis are related to metal film growth on WIS and seek to i contribute to the understanding of atomic scale processes that control film morphological evolution ii elucidate the dynamic competition between nanoscale processes that govern film stress generation and evolution and iii develop methodologies for manipulating and controlling nanoscale film morphology between 2D and 3D Investigations focus on magnetron sputter deposited Ag and Cu films on SiO₂ and amorphous carbon a C substrates Research is conducted by strategically combining of in situ and real time film growth monitoring ex situ chemical and micro structural analysis optical modelling and deterministic growth simulations In the first part the scaling behavior of characteristic morphological transition thicknesses i e percolation and continuous film formation thickness during growth of Ag and Cu films on a C are established as function of deposition rate and temperature These data are interpreted using a theoretical framework based on the droplet growth theory and the kinetic freezing model for island coalescence from which the diffusion rates of film forming species during Ag and Cu growth are estimated By combining experimental data with ab initio molecular dynamics simulations diffusion of multiatomic clusters rather than monomers is identified as the rate limiting structure forming process In the second part the effect of minority metallic or gaseous species Cu N₂ O₂ on Ag film morphological evolution on SiO₂ is studied By employing in situ spectroscopic ellipsometry it is found that addition of minority species at the film growth front promotes 2D morphology but also yields an increased continuous layer resistivity Ex situ analyses show that 2D morphology is favored because minority species hinder the rate of coalescence completion Hence a novel growth manipulation strategy is compiled

in which minority species are deployed with high temporal precision to selectively target specific film growth stages and achieve 2D morphology while retaining optoelectronic properties of pure Ag films. In the third part, the evolution of stress during Ag and Cu film growth on a C and its dependence on growth kinetics as determined by deposition rate, substrate temperature, is systematically investigated. A general trend toward smaller compressive stress magnitudes with increasing temperature, deposition rate, is found, related to increasing grain size, decreasing adatom diffusion length. Exception to this trend is found for Cu films in which oxygen incorporation from the residual growth atmosphere at low deposition rates inhibits adatom diffusivity and decreases the magnitude of compressive stress. The effect of N₂ on stress type and magnitude in Ag films is also studied. While Ag grown in N₂ free atmosphere exhibits a typical compressive stress evolution as function of thickness, addition of a few percent of N₂ yields to a stress turnaround from compressive to tensile stress after film continuity, which is attributed to giant grain growth and film roughening. The overall results of the thesis provide the foundation to i) determine diffusion rates over a wide range of WIS film/substrates systems, ii) design non-invasive strategies for multifunctional contacts in optoelectronic devices, iii) complete important missing pieces in the fundamental understanding of stress, which can be used to expand theoretical descriptions for predicting and tuning stress magnitude.

La morphologie de films minces multicristallins obtenus par condensation d'une phase vapeur sur des substrats faiblement interactifs possède un caractère 3D intrinsèque. De plus, la nature hors équilibre de la croissance du film depuis une phase vapeur conduit souvent à la génération de contraintes mécaniques, ce qui peut compromettre davantage la fiabilité et la fonctionnalité des dispositifs optoelectroniques. Les objectifs de cette thèse sont liés à la croissance de films multicristallins sur SFI et visent à contribuer à une meilleure compréhension des processus à l'échelle atomique qui contrôlent l'évolution morphologique des films, à élucider les processus dynamiques qui régissent la génération et l'évolution des contraintes en cours de croissance, et à développer des méthodologies pour manipuler et contrôler la morphologie des films à l'échelle nanométrique. L'originalité de l'approche mise en œuvre consiste à suivre la croissance des films in situ et en temps réel par couplage de plusieurs diagnostics complémentaires : analyses microstructurales ex situ. Les grandeurs mesurées sont confrontées à des modèles optiques et des simulations atomistiques.

La première partie est consacrée à l'étude du comportement de délamination des paquets de transition morphologiques caractéristiques, savoir la percolation et la continuité du film lors de la croissance de films multicristallins d'Ag et de Cu sur carbone amorphe a-C. Ces grandeurs sont examinées de façon systématique en fonction de la vitesse de dépôt et de la température du substrat et interprétées dans le cadre de la théorie de la croissance de gouttelettes suivant un modèle cinétique décrivant la coalescence de lots, partant duquel les coefficients de diffusion des espèces multicristallines sont estimés. En confrontant les données expérimentales aux simulations par dynamique moléculaire ab initio, la diffusion de clusters multiatomiques est identifiée comme l'étape limitante du processus de croissance. Dans la seconde partie, l'incorporation et l'impact sur la morphologie d'espèces multicristallines ou gazeuses minoritaires Cu, N₂, O₂ lors de la croissance de

film Ag sur SiO₂ est étudié. À partir de mesures ellipsométriques in situ on constate que l'addition de ces minoritaires favorise une morphologie 2D entravant le taux d'achèvement de la coalescence mais donne également une résistivité accrue de la couche continue. Par conséquent une stratégie de manipulation de la croissance est proposée dans laquelle des espèces minoritaires sont déposées avec une grande précision temporelle pour cibler sélectivement des stades de croissance de film spécifiques et obtenir une morphologie 2D tout en conservant les propriétés optoélectroniques des films d'Ag pur. Dans la troisième partie l'évolution des contraintes résiduelles lors de la croissance des films d'Ag et de Cu sur Al₂O₃ et leur dépendance la cinétique de croissance est systématiquement étudiée. On observe une tendance générale vers des amplitudes de contrainte de compression plus faibles avec une augmentation de la température, vitesse de dépôt et l'augmentation de la taille des grains, la diminution de la longueur de diffusion des adatoms, également l'ajout dans le plasma de N₂ sur le type et l'amplitude des contraintes dans les films d'Ag est étudié. L'ajout de quelques pourcents de N₂ en phase gaz donne lieu à un renversement de la contrainte de compression et une évolution en tension au-delà de la continuité du film. Cet effet est attribué à une croissance anormale des grains géants et le développement de rugosité de surface. L'ensemble des résultats obtenus dans cette thèse fournissent les bases pour identifier les coefficients de diffusion sur une large gamme de systèmes films/SFI, concevoir des stratégies non invasives pour les contacts multifonctionnels dans les dispositifs optoélectroniques, apporter des éléments de compréhension l'origine du développement de contrainte qui permettent de prédire et contrôler le niveau de contrainte intrinsèque que la croissance de films minces polycristallins.
