Clinical Management Guidelines for Obstetrician–Gynecologists

NUMBER 227

(Replaces Practice Bulletin Number 204, February 2019)

Committee on Practice Bulletins—Obstetrics and the Society for Maternal-Fetal Medicine. This Practice Bulletin was developed by the American College of Obstetricians and Gynecologists Committee on Practice Bulletins—Obstetrics and the Society for Maternal-Fetal Medicine Publications Committee with the assistance of Henry Galan, MD, and William Grobman, MD.

INTERIM UPDATE: The content in this Practice Bulletin has been updated as highlighted (or removed as necessary) to reflect a limited, focused change in the expanded definition of fetal growth restriction and delivery timing recommendations in the setting of fetal growth restriction.

Fetal Growth Restriction

Fetal growth restriction, also known as intrauterine growth restriction, is a common complication of pregnancy that has been associated with a variety of adverse perinatal outcomes. There is a lack of consensus regarding terminology, etiology, and diagnostic criteria for fetal growth restriction, with uncertainty surrounding the optimal management and timing of delivery for the growth-restricted fetus. An additional challenge is the difficulty in differentiating between the fetus that is constitutionally small and fulfilling its growth potential and the small fetus that is not fulfilling its growth potential because of an underlying pathologic condition. The purpose of this document is to review the topic of fetal growth restriction with a focus on terminology, etiology, diagnostic and surveillance tools, and guidance for management and timing of delivery.

Background

Terminology

The terminology for classifying fetuses and newborns who have failed to achieve weight within population-based norms is inconsistent. Communication between obstetric and newborn practitioners is facilitated by clearly defined terms that characterize fetal and newborn weight according to either the absolute weight or the weight percentile for a given gestational age (1–4). In this document, the term “fetal growth restriction” will be used to describe fetuses with an estimated fetal weight or abdominal circumference that is less than the 10th percentile for gestational age, whereas the term small for gestational age (SGA) will be used exclusively to describe newborns whose birth weight is less than the 10th percentile for gestational age.

Prevalence

The prevalence of fetal growth restriction depends on the definition used. As noted previously, the most frequently used definition of fetal growth restriction is an estimated fetal

weight or abdominal circumference that is less than the 10th percentile for gestational age (5). However, this definition does not take into account the individualized growth potential of each fetus, and its use may fail to identify larger fetuses that have not achieved their growth potential and may be at risk of adverse outcomes. Conversely, this definition will result in the misdiagnosis of fetal growth restriction for some constitutionally small fetuses (6–9). In an attempt to assess more accurately whether newborns and fetuses are of appropriate growth, investigators have devised formulas for individualized growth standards (10, 11). However, use of such formulas has not been shown to improve outcomes.

Etiology

The etiology of fetal growth restriction can be broadly categorized into maternal, fetal, and placental (Box 1). Although the primary pathophysiologic mechanisms underlying these conditions are different, they often (but not always) have the same final common pathway: suboptimal uterine-placental perfusion and fetal nutrition.
