

## Selection and speciation

### Aims

By completing this worksheet students should be able to state examples of other methods of speciation other than geographical isolation. Students should be able to explain what is meant by disruptive selection. They should also be able to draw the shape of a graph representing phenotype or genotype frequency caused by disruptive selection.

### Teacher notes

When completing this worksheet students will need to have covered speciation as they will have to use their knowledge of geographical isolation as a cause of speciation. Students will also need to know about stabilising and directional selection.

For question 5 students should be credited as long as the graph is of the correct shape. Graph paper is not needed. They could be directed to the curves created by stabilising and directional selection in the student book as pointers.

### Answers to questions

- 1 What is the definition of a species?

**A species is a group of individuals that share similar genes and are capable of breeding with each other to produce fertile offspring.**

- 2 Give an example of a selection pressure that could cause directional selection.

**Predation, habitat change (any other reasonable suggestion).**

- 3 A fluctuating environment can cause disruptive selection and a stable environment causes stabilising selection. What type of environment is likely to cause directional selection?

**Directional selection is caused by slowly changing environmental conditions in one direction.**

- 4 Summarise two types of reproductive isolation.

**The mechanisms that contribute to reproductive isolation prevent gene flow between populations that may or may not be geographically isolated. They are the reason that closely related species which live in the same habitat may not reproduce successfully.**

**Geographical isolation occurs when a physical barrier prevents two populations from breeding with one another.**

*Genetics of Mate Choice: From Sexual Selection to Sexual Isolation* W.J. Etges, M.A. Noor, 2012-12-06 Genetic studies aimed at understanding the origin of species are dominating major scientific journals. In the past decade, genetic tools that were previously available only in model systems have become accessible to investigators working on nearly all species. Concurrent with these technical advances has been an increase in understanding of both the importance of considering the ecological context of speciation and testing hypotheses about causes for species formation. Many recent studies suggest a prominent role of sexual selection in species formation. These advances have produced a need for a synthesis of what we now understand about speciation and perhaps more importantly where we should go from here. In this volume, several leading investigators and rising stars have contributed reviews and/or novel primary research findings aimed at understanding the ultimate mystery on which Darwin named his most famous and influential book. Fundamental to the origin of species is the evolution of mate choice systems. This collection of papers discusses burgeoning genetic, evolutionary, and ecological approaches to understanding the origins of mating discrimination and causes of premating reproductive isolation both within and between species. The individual contributions span a wide spectrum of disciplines, taxa, and ideas, some controversial. This synthesis brings together several of the most recent ideas with supporting empirical data. This book will be of particular interest to both undergraduate and postgraduate researchers and students and researchers in the field of evolutionary biology, genetics, and animal behaviour.

outgrowth of an Arthur M Sackler Colloquium sponsored by the National Academy of Sciences on January 16 17 2009 In the chapters of this book leading evolutionary biologists and science historians reflect on and commemorate the Darwinian Revolution They canvass modern research approaches and current scientific thought on each of the three main categories of selection natural artificial and sexual that Darwin addressed during his career Although Darwin's legacy is associated primarily with the illumination of natural selection in *The Origin* he also contemplated and wrote extensively about what we now term artificial selection and sexual selection In a concluding section of this book several science historians comment on Darwin's seminal contributions Two Centuries of Darwin is the third book of the In the Light of Evolution series Each installment in the series explores evolutionary perspectives on a particular biological topic that is scientifically intriguing but also has special relevance to contemporary societal issues or challenges The ILE series aims to interpret phenomena in various areas of biology through the lens of evolution and address some of the most intellectually engaging as well as pragmatically important societal issues of our times

presented under Theme 3 of the 13th International Symposium on Ostracoda Chatham UK in 1997 which are grouped in the present proceedings one of three volumes resulting from this meeting The contributions deal with the evolution of both extant and fossil forms including most of the Phanerozoic ecology of both marine and freshwater taxa and developmental morphology of both soft parts and valves Although the canvas is wide each paper clearly shows how studies on Ostracoda can be relevant to general theory on evolutionary biology and ecology
