

## Chapter 31: Fungi

### *Concept 31.1 Fungi are heterotrophs that feed by absorption*

- Fungi are heterotrophs that acquire their nutrients by absorption.
  - Powerful hydrolytic enzymes secreted by the fungus break down food outside its body into simpler compounds that the fungus can absorb and use.
  - Fungi then absorb small organic molecules from the surrounding medium.
- The absorptive mode of nutrition is associated with the ecological roles of fungi as decomposers.
- Decomposer fungi break down and absorb nutrients from nonliving organisms.

### *The ecological success of fungi is partially due to a body structure that increases the efficiency of nutrient absorption.*

- Yeasts are single-celled fungi, but most species of fungi are multicellular.
- The vegetative bodies of multicellular fungi are constructed of tiny filaments called **hyphae** that form an interwoven mat called a **mycelium** that infiltrates the material on which the fungus feeds.
  - Fungal mycelia can be huge, but they usually escape notice because they are subterranean.
- Fungal hyphae have cell walls built mainly of **chitin**, a strong but flexible nitrogen-containing polysaccharide identical to that found in arthropods.
- The filamentous structure of the mycelium provides an extensive surface area that suits the absorptive nutrition of fungi.
- Most fungi are multicellular with hyphae divided into cells by cross walls, or **septa**.
  - Septa generally have pores large enough for ribosomes, mitochondria, and even nuclei to flow from cell to cell.
- Mutually beneficial relationships between fungi and plant roots are called **mycorrhizae**.
- Mycorrhizal fungi can improve the delivery of phosphate ions and other minerals to plants because the vast mycelial networks of fungi can effectively acquire these minerals from the soil.
  - In exchange, the plants supply the fungi with organic nutrients such as carbohydrates.

### *Concept 31.2 Fungi produce spores through sexual or asexual life cycles*

- Fungi reproduce by producing vast numbers of spores, either sexually or asexually.
  - The output of spores from one reproductive structure can be enormous: puffballs release trillions of spores in cloud-like bursts.
- Dispersed widely by wind or water, spores germinate to produce mycelia if they land in a moist place where there is food.
- Sexual reproduction in fungi begins when hyphae from two genetically distinct mycelia fuse.

### *Concept 31.5 Fungi play key roles in nutrient cycling, ecological interactions, and human welfare*

#### *Fungi and animals may be mutualistic symbionts.*

- Some fungi break down plant material in the guts of cows and other grazers.
- Many species of ants and termites raise fungi in “farms” and feed them leaves.
  - The fungi break the leaves down into a substance that the insects can digest and feed the ants with specialized swollen hyphal tips that are rich in proteins and carbohydrates.
