

3.CURRENT ELECTRICITY

- Resistivity of metals increases with increase in temperature as $\rho_t = \rho_0 (1 + \alpha t)$. where ρ_0 and ρ_t are resistivity of metals at 0°C and $t^\circ\text{C}$ and ' α ' temperature coefficient of resistivity of the material.
- For metals ' α ' is positive, for some alloys like nichrome, manganin and constantan, α is positive but very low.
- For semiconductors and insulators, α is negative.

Velocities of charged particle (electron) in a conductor

****THERMAL VELOCITY**: Due to temperature and thermal energy electrons have a thermal velocity of 10^5 ms^{-1} . This velocity is in all directions and of magnitudes varying from zero to maximum. Due to large number of electrons we can assume that vector sum of thermal velocities at any instant is zero.

****Mean Free path**: The path between two consecutive collisions is called free path. The average length of these free paths is called "Mean Free Path".

****Relaxation Time**: The time to travel mean free path is called Relaxation Period or Relaxation Time, denoted by Greek letter Tau " τ ".

****Drift Velocity(V_d)**: When Electric Field is applied across a conductor, the free electrons experience a force in the direction opposite to field. Due to this force they start drifting in the direction of force. The Velocity of this drift is called drift velocity " V_d ".

"The average velocity attained by charged particles, (eg. electrons) in a material due to an electric field."

Relation between drift-velocity (V_d) and electric field(E) applied.

OR Expression for drift velocity

When electric field is applied across a conductor each electron experience a Force, $F = qE$ in the direction of force. But according to Newton's second law $F = ma$

$$qE = ma \quad \text{but for electron } q = e$$

$$a = \frac{eE}{m} \text{ --- (1)}$$

above equation represents acceleration of electron due to electric field. There for electron is drifted due to this acceleration and attains drift velocity(V_d) is given by

$$v = u + at$$

but for electron $v = V_d$

$u = 0 \text{ ms}^{-1}$ (Initial Thermal velocity of electrons)

a = Acceleration of electron from equation (1)

$t = \tau$ (Relaxation time)

$$V_d = \frac{eE}{m} \tau$$
