singularity theory The volume begins with an outstanding exposition on Jim Damon's contributions to singularity theory and its applications Jim passed away in 2022 and he was one of the greatest mathematicians of recent times having made remarkable contributions to singularity theory and its applications mostly to medical image computing The next chapter focuses on the singularities of real functions and their bifurcation sets Then we look at the perturbation theory of polynomials and linear operators complex analytic frontal singularities the global singularity theory of differentiable maps and the singularities of holomorphic functions from a global point of view The volume continues with an overview of new tools in singularity theory that spring from symplectic geometry and Floer type homology theories Then it looks at the derivation of Lie algebras of isolated singularities and the three dimensional rational isolated complete intersection singularities as well as recent developments in algebraic K stability and the stable degeneration conjecture This volume also contains an interesting survey on V filtrations a theory began by Malgrange and Kashiwara that can be used to study nearby and vanishing cycle functors and introduced by Deligne Then we present a panoramic view of the Hodge toric and motivic methods in the study of Milnor fibers in singularity theory both from local and global points of view The Monodromy conjecture is also explained this is a longstanding open problem in singularity theory that lies at the crossroads of number theory algebra analysis geometry and topology This volume closes with recent developments in the study of the algebraic complexity of optimization problems in applied algebraic geometry and algebraic statistics The book is addressed to graduate students and newcomers to the theory as well as to specialists who can use it as a guidebook

*Theoretical Determination of the Form of the Hollow Produced in the Solar Corpuscular Stream by Interaction with the Magnetic Dipole Field of the Earth* John R. Spreiter, Benjamin R. Briggs, 1961 The interaction between a neutral stream of ionized solar corpuscles and a three

dimensional magnetic dipole representing the geomagnetic field is investigated. It is assumed that the stream is confined to the exterior and the magnetic field to the interior of a hollow the boundary of which is defined by a thin current sheath. An approximate method of solution is applied and results are presented for the coordinates of the trace of the boundary of the hollow in the meridian plane containing the sun earth line and the dipole axis for several relative orientations. Results are also presented for the trace in the equatorial plane for the case in which the dipole axis is normal to the sun earth line. The corresponding problem in two dimensions is also considered and it is shown that the analogous approximate results are in good agreement with the results indicated by an exact solution of the same basic equations. **Applied Linear Algebra and Matrix Analysis** Thomas S. Shores, 2018-05-02 This new book offers a fresh approach to matrix and linear algebra by providing a balanced blend of applications theory and computation while highlighting their interdependence. Intended for a one semester course Applied Linear Algebra and Matrix Analysis places special emphasis on linear algebra as an experimental science with numerous examples computer exercises and projects. While the flavor is heavily computational and experimental the text is independent of specific hardware or software platforms. Throughout the book significant motivating examples are woven into the text and each section ends with a set of exercises

**Pseudo-riemannian Geometry, Delta-invariants And Applications** Bang-yen Chen, 2011-03-23 The first part of this book provides a self contained and accessible introduction to the subject in the general setting of pseudo Riemannian

manifolds and their non degenerate submanifolds only assuming from the reader some basic knowledge about manifold theory A number of recent results on pseudo Riemannian submanifolds are also included The second part of this book is on invariants which was introduced in the early 1990s by the author The famous Nash embedding theorem published in 1956 was aimed for in the hope that if Riemannian manifolds could be regarded as Riemannian submanifolds this would then yield the opportunity to use extrinsic help However this hope had not been materialized as pointed out by M Gromov in his 1985 article published in *Asterisque* The main reason for this is the lack of control of the extrinsic invariants of the submanifolds by known intrinsic invariants In order to overcome such difficulties as well as to provide answers for an open question on minimal immersions the author introduced in the early 1990s new types of Riemannian invariants known as invariants which are very different in nature from the classical Ricci and scalar curvatures At the same time he was able to establish general optimal relations between invariants and the main extrinsic invariants Since then many new results concerning these invariants have been obtained by many geometers The second part of this book is to provide an extensive and comprehensive survey over this very active field of research done during the last two decades

*Computer Processing of Remotely-Sensed Images* Paul M. Mather, Magaly Koch, 2022-04-06 Computer Processing of Remotely Sensed Images A thorough introduction to computer processing of remotely sensed images processing methods and applications Remote sensing is a crucial form of measurement that allows for the gauging of an object or space without direct physical contact allowing for the assessment and recording of a target under conditions which would normally render access difficult or impossible This is done through the analysis and interpretation of electromagnetic radiation EMR that is reflected or emitted by an object surveyed and recorded by an observer or instrument that is not in contact with the target This methodology is particularly of importance in Earth observation by remote sensing wherein airborne or satellite borne instruments of EMR provide data on the planet's land seas ice and atmosphere This permits scientists to establish relationships between the measurements and the nature and distribution of phenomena on the Earth's surface or within the atmosphere Still relying on a visual and conceptual approach to the material the fifth edition of this successful textbook provides students with methods of computer processing of remotely sensed data and introduces them to environmental applications which make use of remotely sensed images The new edition's content has been rearranged to be more clearly focused on image processing methods and applications in remote sensing with new examples including material on the Copernicus missions microsatellites and recently launched SAR satellites as well as time series analysis methods The fifth edition of *Computer Processing of Remotely Sensed Images* also contains A cohesive presentation of the fundamental components of Earth observation remote sensing that is easy to understand and highly digestible Largely non technical language providing insights into more advanced topics that may be too difficult for a non mathematician to understand Illustrations and example boxes throughout the book to illustrate concepts as well as revised examples that reflect the latest information References and links to the most up to date online and open access sources used by students *Computer Processing of Remotely Sensed Images* is a highly insightful textbook for advanced undergraduates and postgraduate students taking courses in remote sensing and GIS in Geography Geology and Earth Environmental Science departments
