Environmental remote sensing plays a critical role in observing key hydrological components such as precipitation soil moisture evapotranspiration and total water storage on a global scale As water security is one of the most critical issues in the world satellite remote sensing techniques are of particular importance for emerging regions which have inadequate in situ gauge observations This book reviews multiple remote sensing observations the application of remote sensing in hydrological modeling data assimilation and hydrological capacity building in emerging regions **System Engineering**

Applied to Fuenmayor Karst Aquifer (San Julián de Banzo, Huesca) and Collins Glacier (King George Island, Antarctica) David Chinarro, 2014-07-19 This thesis tackles fundamental questions concerning the discharge of a pre Pyrenean karst aquifer system and an Antarctic glacier system utilizing a system engineering methodology and data driven

approach It presents for the first time a simplified and effective linear transfer function for karst aquifers The author provides detailed wavelet spectrum results which reveal certain non linearities in drought periods In addition structures based on Hammerstein Wiener blocks have yielded a nonlinear model that is substantially more efficient than its linear counterparts Another pioneering finding is the use of wavelet coherence between glacier discharge and air temperature to estimate SEC Seasonal Effective Core boundaries The yearly SEC is essential to obtaining a model based on Hammerstein Wiener structures which offers considerably higher efficiency Moreover two different types of glacier dynamics have been discovered over damped and overshoot depending on the annual cycle and the SEC average temperature *Cave*
