Transformative Eco-Education for Human and Planetary Survival Jing Lin, Rebecca L. Oxford, 2011-12-01 Transformative eco education is environmental education that is literally needed to transform and save our planet especially during the global ecological crises of our present century Such education demands inner transformation of many deeply rooted ideas such as the following the Earth exists merely to provide for human comfort the extinction or reduction of other species does not matter we are free to consume or destroy natural resources at will but are safe from destruction ourselves and the Earth will continue to sustain us even if we do not sustain the Earth Unless these concepts are changed we will increase global warming and add to the ruin of much of the Earth This book presents powerful ideas for transformative eco education At this time of ever increasing ecological crisis such education is needed more than ever before We urge readers to use the ideas and activities in this book with your students develop them further and create new conceptions to share with other educators and students The chapters in this book provide key principles of which the following are just a few First educators can and should prepare students for natural disasters Second stories case studies the arts and hands on environmental experience all

enriched by reflection and discussion can offer profound learning about ecology Third education at all levels can benefit from a true ecological emphasis Fourth teachers must receive preparation in how to employ transformative eco education Fifth Indigenous wisdom can offer important holistic spiritual paths to understanding and caring for nature and other spiritual traditions also provide valid ways of comprehending humans as part of the universal web of existence Sixth transformative eco education can be an antidote to not only to environmental breakdown but also to materialistic overconsumption and moral confusion Seventh we can only heal the Earth by also healing ourselves If we heed these principles together we can make transformative eco education a blazing torch to light the path for the current century and beyond *Robotics*

Kazakov,2012-12-19 The content of the book is based on the lectures on the theory of elasticity stability and dynamics of structures The importance of these disciplines in the preparation of young structural engineers for work in the practice cannot be overemphasized The university training in such fundamental discipline must seek to build a strong foundation and to illustrate the application of the used methods to practical engineering problems The solution of a structural engineering problem usually consists of three basic steps the simplification to such a state of idealization that it can be expressed in allegorical or geometrical form the solution of this mathematical form and the interpretation of the results of the solution in terms of the engineering needs By successive illustration of these three steps in the solution of each problem the student must be led and encouraged to approach the solution of his own engineering problems in a similar way or in similar manner with a desired degree of accuracy in the final result *Virtual Teacher* Boris Aberšek,Janez Bregant,2014-10-17 Today in the age of technology contemporary researchers from the fields of philosophy cognitive science neurobiology and artificial intelligence ask many questions about the nature of the mind and body originating in ancient Greek philosophy Among those are also questions about the relationship between humans and machines and the implications this carries for solving

traditional problems within philosophy In this book the term machine is taken to refer to every system which in the contemporary world tries to make a task easier for humans or even tries to replace the human altogether such as a humanoid robot able to perform different physical activities as well as various mental activities like decision making and problem solving The volume makes the first step towards a connection between certain different disciplines involved in education The gap between neurochemistry cognitive science neurobiology and other rapidly developing disciplines on one side and education as part of social sciences on the other currently appears to be great and even unbridgeable except by analogy metonymy and metaphor From the experiences of recent years it seems clear that the existing educational system as a whole is perceived as an ailing system that fails to meet the needs of a major portion of the society it serves This book brings to attention a form of learning that transcends logic and rhetorical appeal It defines appropriate architecture on the basis of cognitive science and methods of artificial intelligence taking into account that a school system is a dynamical system which follows the dynamical systems theory The volume shows how to build an intelligent tutoring system and an intelligent teaching learning system upon it Through the use of intelligent tutoring systems students are placed in an active role as opposed to the passive role that they more or less have today
