

- Chapter One: Big Ideas In Biology
  - Biological systems interact, and these systems and their interactions possess complex properties.
    - The cell is an organism's basic unit of structure and function
      - Study of life can be divided into different levels of biological organization and examined at different scales
    - New properties emerge at successive levels of biological organization
      - emergent properties result from the arrangement and interaction of parts within a system as complexity increases
        - Ex: a functioning bicycle emerges only when all of the necessary parts connect in the correct way
  - Biological systems utilize free energy and molecular building blocks to grow, reproduce, and maintain dynamic homeostasis
    - Life requires the transfer and transformation of energy and matter
      - Input of energy primarily comes from sun, light energy transfers into other forms to make life possible
      - Once energy is consumed, it can be used to do work
      - Energy flow is 1 way through ecosystem: usually enters as light and leaves as heat
    - Feedback mechanisms regulate biological systems
      - Feedback loops: the output of a system amplifies the system (positive feedback) or inhibits the system (negative feedback)
        - Negative feedback is more common than positive feedback
  - Living systems store, retrieve, transmit, and respond to information essential to life processes
    - Life's processes involve expression and transmission of genetic information
      - DNA is inherited by offspring from their parents, controls the development and maintenance of organisms
  - The process of evolution drives the diversity and unity of life
    - Interactions with other organisms and the physical environment are important. Those that survive these interactions go on to reproduce. Genetic traits from those that reproduce are passed on, so offspring are better matched to their environment.
      - Structure and function are correlated at ALL levels
      - Evolution accounts for the unity and diversity of life!
- Chapter One: Characteristics Of Life!
  - Organisms that are living can:
    - Grow and develop
    - Reproduce
    - Use and store energy/metabolize
    - Respond to stimuli and their environment
    - Adapt and evolve
    - Have DNA

## **Collaborative Society**

Dariusz Jemielniak,Aleksandra Przegalinska,2020-02-18 How networked technology enables the emergence of a new collaborative society Humans are hard wired for collaboration and new technologies of communication act as a super amplifier of our natural collaborative mindset This volume in the MIT Press Essential Knowledge series examines the emergence of a new kind of social collaboration enabled by networked technologies This new collaborative society might be characterized as a series of services and startups that enable peer to peer exchanges and interactions though technology Some believe that the economic aspects of the new collaboration have the potential to make society more equitable others see collaborative communities based on sharing as a cover for social injustice and user exploitation The book covers the

sharing economy and the hijacking of the term by corporations different models of peer production and motivations to participate collaborative media production and consumption the definitions of amateur and professional and the power of memes hactivism and social movements including Anonymous and anti ACTA protest collaborative knowledge creation including citizen science collaborative self tracking and internet mediated social relations as seen in the use of Instagram Snapchat and Tinder Finally the book considers the future of these collaborative tendencies and the disruptions caused by fake news bots and other challenges

**Interaction Networks in Protein Folding and Degradation** Walid A. Houry,2014-09-01 Molecular chaperones are a fundamental group of proteins that have been identified only relatively recently They are key components of a protein quality machinery in the cell which insures that the folding process of any newly synthesized polypeptide chain results in the formation of a properly folded protein and that the folded protein is maintained in an active conformation throughout its functional lifetime Molecular chaperones have been shown to play essential roles in cell viability under both normal and stress conditions Chaperones can also assist in the unfolding and degradation of misfolded proteins and in disaggregating preformed protein aggregates Chaperones are also involved in other cellular functions including protein translocation across membranes vesicle fusion events and protein secretion In recent years tremendous advances have been made in our understanding of the biology biochemistry and biophysics of function of molecular chaperones In addition recent technical developments in the fields of proteomics and genomics allowed us to obtain a global view of chaperone interaction networks Finally there is now a growing interest in the role of molecular chaperones in diseases This book will provide a comprehensive analysis of the structure and function of the diverse systems of molecular chaperones and their role in cell stress responses and in diseases from a global network perspective
