

AP Biology Lab - Cell Respiration

This investigation uses respirometry techniques to calculate the rate of oxygen consumption (cellular respiration) in germinating pea seeds. The effect of temperature and whether a seed has broken dormancy are quantified and graphed. The ideal gas law and its concepts are reviewed and applied.

Objectives

- Understand the relationships between temperature, pressure and volume.
- Study the effects of diffusion through a semipermeable membrane
- Quantify oxygen consumption rates in germinating peas under different conditions
- Predict the effect of temperature and germination state on the rate of cell respiration

Background

Each individual cell is responsible for the energy exchanges necessary to sustain its ordered structure. Cells accomplish this task by breaking down nutrient molecules to generate ATP (adenosine triphosphate), which can then be used to run cellular processes that require energy. This process is called cellular respiration which requires nutrient molecules and oxygen. Carbon dioxide and water are products of the series of reactions involved in cellular respiration.
