Opuntia spp.: Chemistry, Bioactivity and Industrial Applications Mohamed Fawzy Ramadan, Tamer E. Moussa Ayoub, Sascha Rohn, 2021-09-27 The Opuntia fruits commonly known as cactus pears or prickly pears have been suggested by the Food and Agriculture Organization to be a promising and strategic crop in regions suffering from lack of water In Mexico India South Africa and the Mediterranean the

Opuntia fruits have become popular due to their nutritive value and health promoting benefits including antioxidant antiulcerogenic and antiatherogenic traits and protective effects against LDL oxidation. Additionally, readily absorbable sugars, high vitamin C and mineral content and a pleasant flavour make Opuntia tailor made for novel foods. Due to their ecological advantages, high functional value and health related traits, Opuntia fruits can be highly exploited in different food processing applications. For instance, Opuntia cactus fruits are used for the preparation of juices and marmalades. Opuntia cactus plants are used to feed animals in African and Latin American countries. Peruvian farmers cultivate Opuntia cactus for growing the cochineal *Dactylopius coccus* insect and producing the natural dye carmine and the commercial production of food and non food products from Opuntia has been established in Mexico, USA and several Mediterranean countries. Opuntia spp. Chemistry, Bioactivity and Industrial Applications creates a multidisciplinary forum of discussion on Opuntia cactus with special emphasis on its horticulture, post harvest marketability, chemistry, functionality, health promoting properties, technology and processing. The text includes detailed discussion of the impact of traditional and innovative processing on the recovery of high added value compounds from Opuntia spp. by products. Later chapters explore the potential applications of Opuntia spp. in food, cosmetics and pharmaceutical products. **Selected Water Resources Abstracts**, 1980-05

Marine Ecosystem Assessment for the Southern Ocean: Meeting the Challenge for Conserving Earth Ecosystems in the Long Term Monica M. C. Muelbert, 2024-12-24. National and international agencies need assessments of change in ecosystems and their drivers in order to sustain natural systems to maintain the delivery of services and to meet the challenge for conserving Earth ecosystems in the long term. In marine systems, change may arise directly from human activities, e.g. fisheries, indirectly from local or global activities cascading effects through food webs from fisheries or changing environments from climate change and/or ocean acidification or from naturally varying processes. A particular challenge for managers is to identify how dangerous future climate change will be for ecosystems and their services and whether

mitigation or adaptation may be needed in advance in order to achieve the conservation requirements For regions of international attention particularly those that have the attention of many management or policy oriented bodies a standardized process is needed to harmonize the scientific information on the status and trends in ecosystems used by the different bodies That process also needs to ensure the information is available in a timely manner For example assessments of change in habitats species and or food webs in the Southern Ocean are currently compiled separately for at least ten different international organizations or processes A Marine Ecosystem Assessment for the Southern Ocean MEASO aims to harmonize that information for policy makers This assessment began with an international conference in April 2018 <http://www.measo2018.aq> where it was agreed to undertake the first MEASO over 2018-2019 with the view to provide the outcomes to relevant bodies such as the Scientific Committee for the Conservation of Antarctic Marine Living Resources soon after
