Berry Ottaway, 2012-12-06 The last

few years have seen a growing consumer awareness of nutrition and healthy eating in general. As a consequence the food industry has become more concerned with the nutritional value of products and the maintenance of guaranteed micronutrient levels. While the food industry has the responsibility of producing foods that provide a realistic supply of nutrients including vitamins, it is now also required to offer produce with a high degree of convenience and a long shelf life. Vitamins are relatively unstable, being affected by factors such as heat, light, and other food components, but also by the processes needed to preserve the goods or to convert them into consumer products such as pasteurization, sterilization, extrusion, and irradiation. The result of these interactions may be a partial or total degradation of the vitamins. Food technology is concerned with both the maintenance of vitamin levels in foods and the restoration of the vitamin content to foods where losses have occurred. In addition, foods designed for special nutritional purposes such as infant food and slimming goods need to be enriched or fortified with vitamins and other micronutrients. This book reviews vitamins as ingredients of industrially manufactured food products. The technology of their production and use is covered from the food technologists' and engineers' points of view. Detailed coverage is also provided of other technical aspects such as analysis, stability, and the use of vitamins as food technological aids.

Bioavailability and Analysis of Vitamins in Foods G. F. M. Ball, 2013-11-11 Every country in the world is concerned with the nutritional status of its population and in utilizing its natural food resources in the most effective way possible. Surveys based on food intakes and food compositional data are being conducted with the object of establishing recommended intakes of vitamins. These recommendations are constantly being changed as new knowledge comes to light. Analytical techniques using physicochemical and microbiological methods have been largely developed to determine the total vitamin content of a food commodity or diet using the most rigorous extraction method commensurate with the stability of the vitamin. The extraction procedures frequently involve prolonged heating of suitably prepared food samples at extremes of pH to liberate vitamins from chemically bound forms in the food matrix or to remove a preponderance of fat from fatty foods. For several vitamins the data obtained by these means grossly overestimate the nutritional value of the food because the human digestive system fails to liberate bound vitamin forms for subsequent absorption by the intestine. This statement is borne out by reports of vitamin deficiency in situations where the dietary supply of vitamin is adequate on the basis of conventional analysis. Various research laboratories are directing their effort toward the estimation of bioavailable vitamin, i.e. the proportion of vitamin in the food which is available for utilization by the body. So far few data have been published and there are many gaps in the knowledge required to interpret experimental results.
