Advanced Nano-Bio Technologies for Water and Soil Treatment Jan Filip, Tomáš Cajthaml, Petra Najmanová, Miroslav Černík, Radek Zbořil, 2020-01-17 We are proposing this comprehensive volume aimed at bridging and bonding of the theory and practical experiences for the elimination of a broad range of pollutants from various types of water and soil utilizing innovative nanotechnologies, biotechnologies and their possible combinations Nowadays a broad range of contaminants are emerging from the industry and also representing old ecological burdens Accidents and improper wastewater treatment requires a fast, efficient and cost effective approach Therefore several innovative technologies of water and soil treatments have been invented and suggested in a number of published papers Out of these some nanotechnologies and biotechnologies and possibly also their mutual combinations turned out to be promising for practical utilization i.e. based on both extensive laboratory testing and pilot scale verification With respect to the diverse character of targeted pollutants the key technologies covered in this book will include oxidation, reduction, sorption and/or biological degradation In relation to innovative technologies and new emerging pollutants mentioned in this proposed book an important part will also cover the ecotoxicity of selected pollutants and novel nanomaterials used for remediation Thus this work will consist of 8 sections, chapters with a technical appendix as an important part of the book where some technical details and standardized protocols

will be clearly presented for their possible implementation at different contaminated sites Although many previously published papers and books or book chapters are devoted to some aspects of nano biotechnologies here we will bring a first complete and comprehensive treatise on the latest progress in innovative technologies with a clear demonstration of the applicability of particular methods based on results of the authors from pilot tests i e based on the data collected within several applied projects mainly national project Environmentally friendly nanotechnologies and biotechnologies in water and soil treatment of the Technology Agency of the Czech Republic and 7FP project NANOREM Taking Nanotechnological Remediation Processes from Lab Scale to End User Applications for the Restoration of a Clean Environment This multidisciplinary book will be suitable for a broad audience including environmental scientists practitioners policymakers and toxicologists and of course graduate students of diverse fields material science chemistry biology geology hydrogeology engineering etc

Mutation research Charlotte Auerbach, 2013-11-11 This book is intended for the senior undergraduate Honours student in genetics and for the postgraduate who wants a survey of the whole field or information on a special area within it In order to cater for readers with such different requirements I have made the list of references unusually large for a textbook It includes classical papers as well as very recent ones to the end of 1974 reviews as well as specialized articles elementary expositions from Scientific American as well as highly technical papers from journals on genetics and molecular biology In areas of active research I have given preference to the latest references which will lead the reader to earlier ones In addition to the references at the end of each chapter a bibliography at the end of the book lists relevant books and general reviews Apart from the first chapter the book is not written as a history of mutation research but throughout I have tried to emphasize the continuity of the problems concepts and ideas The reader will find many examples of this Muller s once famous and then almost forgotten classification of genes by their action has now been given biochemical reality by studies of gene action in vitro The problem of whether mutations can arise in non replicating genomes is one of the oldest in mutation research yet an unequivocal solution was obtained only recently with bacteriophage

The History of Alternative Test Methods in Toxicology, 2018-10-20

The History of Alternative Test Methods in Toxicology uses a chronological approach to demonstrate how the use of alternative methods has evolved from their conception as adjuncts to traditional animal toxicity tests to replacements for them. This volume in the History of Toxicology and Environmental Health series explores the history of alternative test development, validation and use with an emphasis on humanity and good science in line with the Three Rs Replacement Reduction Refinement concept expounded by William Russell and Rex Burch in 1959 in their now classic volume *The Principles of Humane Experimental Technique*. The book describes the historical development of technologies that have influenced the application of alternatives in toxicology and safety testing. These range from single cell monocultures to sophisticated miniaturised and microfluidic organism on a chip devices and also include molecular modelling, chemoinformatics and QSAR analysis and the use of stem cells, tissue engineering and hollow fibre bioreactors. This has been facilitated by the wider availability of human tissues, advances in tissue culture, analytical and diagnostic methods, increases in computational processing capabilities and a greater understanding of cell biology and molecular mechanisms of toxicity. These technological developments have enhanced the range and information content of the toxicity endpoints detected and therefore the relevance of test systems and data interpretation while new techniques for non invasive diagnostic imaging and high resolution detection methods have permitted an increased role for human studies. Several key examples of how these technologies are being harnessed to meet 21st century safety assessment challenges are provided including their deployment in integrated testing schemes in conjunction with kinetic modelling and in specialized areas such as inhalation toxicity studies.
