

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The EG performed a 10-week training program consisting of 3 sessions per week of aerobic and resistance exercise. The CG performed no exercise. The HR and BP were measured at baseline and at the end of the 10-week training program. The EG showed a significant decrease in HR and BP compared to the CG. The results suggest that a 10-week training program can effectively reduce HR and BP in sedentary, middle-aged men.
