Wöhler, 2009-07-28 This work provides an introduction to the foundations of three dimensional computer vision and describes recent contributions to the field which are of methodical and application specific nature Each chapter of this work provides an extensive overview of the corresponding state of the art into which a detailed description of new methods or evaluation results in application specific systems is embedded Geometric approaches to three dimensional scene reconstruction of Chapter 1 are primarily based on the concept of bundle adjustment which has been developed more than 100 years ago in the domain of photogrammetry The three dimensional scene structure and the intrinsic and extrinsic camera parameters are determined such that the Euclidean backprojection error in the image plane is minimised usually relying on a nonlinear optimisation procedure In the field of computer vision an alternative framework based on projective geometry has emerged during the last two decades which allows to use linear algebra techniques for three dimensional scene reconstruction and camera calibration purposes With special emphasis on the problems of stereo image analysis and camera calibration these fairly different approaches are related to each other in the presented work and their advantages and drawbacks are stated In this context various state of the art camera calibration and self calibration methods as well as recent contributions towards automated camera calibration systems are described An overview of classical and new feature based correlation based dense and spatio-temporal methods for establishing point correspondences between pairs of stereo images is given **Augmented**

An Introduction to 3D Computer Vision Techniques and Algorithms Boguslaw Cyganek, J. Paul Siebert, 2011-08-10 Computer vision encompasses the construction of integrated vision systems and the application of vision to problems of real world importance The process of creating 3D models is still rather difficult requiring mechanical measurement of the camera positions or manual alignment of partial 3D views of a scene However using algorithms it is possible to take a collection of stereo pair images of a scene and then automatically produce a photo realistic geometrically accurate digital 3D model This book provides a comprehensive introduction to the methods theories and algorithms of 3D computer vision Almost every theoretical issue is underpinned with practical implementation or a working algorithm using pseudo code and complete code written in C and MatLab There is the additional clarification of an accompanying website with downloadable software case studies and exercises Organised in three parts Cyganek and Siebert give a brief history of vision research and subsequently present basic low level image processing operations for image matching including a separate chapter on image matching algorithms explain scale space vision as well as space reconstruction and multiview integration demonstrate a variety of practical applications for 3D surface imaging and analysis provide concise appendices on topics such as the basics of projective geometry and tensor calculus for image processing distortion and noise in images plus image warping procedures *An Introduction to 3D Computer Vision Algorithms and Techniques* is a valuable reference for practitioners and programmers working in 3D computer vision image processing and analysis as well as computer visualisation It would also be of interest to advanced students and researchers in the fields of engineering computer science clinical photography robotics graphics and mathematics **1996**
