Sharon, Maheshwar Sharon, 2015-07-27 Often described as a miracle material, graphene's potential applications are extraordinary, ranging from nanoscale green technologies to sensors and future conductive coatings. This book covers the topic of graphene: the history, fundamental properties, methods of production, and applications of this exciting new material. The style of the book is both scientific and technical; it is accessible to an audience that has a general undergraduate level background in the sciences or engineering and is aimed at industries considering graphene applications. As the graphene topic is a broad, reaching, and rapidly moving field of research, the aim of this book is therefore to provide information about graphene and its current and future applications that are immediately implementable, relevant, and concise. After reading this book, the reader will have sufficient knowledge and background to move forward independently into graphene R D and to apply the knowledge therein. Although the book will be self-contained, each chapter has copious references to enable further reading, research, and exploration of the chapter topics. **INDUSTRY 4.0** Dr. Anand Kumar Singh, Dr. Manish

Gangil, 2022-04-25 The book is based on the syllabus of Industry 4.0 for the pre-final year engineering students of all disciplines of Gujarat Technological University, Gujarat. The first industrial revolution came with the advent of mechanisation, steam power, and water power, which the human learned, then followed by the second industrial revolution, which revolved around mass production and assembly lines using electricity. The third industrial revolution came with electronics, IT systems, and automation, which led to the fourth industrial revolution, that is associated with cyber-physical systems. Generally speaking, Industry 4.0 describes the growing trend towards automation and data exchange in technology and processes within the manufacturing industry, including Internet of Things (IoT), Industrial Internet of Things (IIoT), Cyber-physical systems, CPS, Smart manufacturing, Smart factories, Cloud computing, Cognitive computing, Artificial Intelligence (AI). This automation creates a manufacturing system whereby machines in factories are augmented with wireless connectivity and sensors to monitor and visualise an entire production process and make autonomous decisions. The fourth industrial revolution also relates to digital twin technologies. These digital technologies can create virtual versions of real-world installations, processes, and applications. These can then be robustly tested to make cost-effective, decentralised decisions. Industry 4.0 has already been demonstrated through business models such as offline programming and adaptive control for arc welding, taking the process from product design through simulation and onto the shop floor for production. **The American Printer**, 1928
