The Combined Sharon/Anammox Process L. G. J. M. van Dongen,M. S. M. Jetten,Mark C. M. van Loosdrecht,2001-09-30 Wastewater treatment management alongside many other industries is seeking to attain a higher degree of sustainability for its processes by focusing on new technologies which minimise the consumption of resources or even recover them from the wastewater Conventional removal of ammonium requires usually large amounts of energy for aeration and organic carbon for denitrification This report focuses on making the nitrogen removal process more sustainable

This can be achieved by a partial oxidation of ammonium to nitrite after which the nitrate produced can be converted into nitrogen gas with the rest of ammonium under anoxic conditions. The treatment of nitrogen rich water can be carried out beneficially by a combination of the Sharon process with the Anammox process. In this combined process less than 50% of the aeration energy is needed, no COD is required and an insignificant amount of sludge is produced. In this Report the potential of using this technology for the treatment of water arising from sludge treatment at a municipal wastewater treatment plant (WWTP) is evaluated and the results of the operation of the system are described in detail. This reject water contains a significant fraction of the N load towards the wastewater treatment plant. The results are used in an economic evaluation of a potential full scale installation. The Combined Sharon Anammox Process Report will provide an invaluable source of information for all those concerned with the efficient and sustainable treatment of wastewater including plant managers, process designers, consultants and researchers.

Phenotyping at Plant and Cell Levels: The Quest for Tolerant Crop Development, volume II Ulrich Schurr, Carla Pinheiro, Dionysia Apostolos Fasoula, Estelle Goulas, Sebastien Christian Carpentier, Astrid Junker, 2023-11-22. This Research Topic is part of the Phenotyping at Plant and Cell Levels: The Quest for Tolerant Crop Development series. Phenotyping at Plant and Cell Levels: The Quest for Tolerant Crop Development. This Research Topic aims at accelerating the discovery of crop varieties that are able to withstand environmental stresses via the use of phenotyping approaches at the plant and cellular levels. Climate change is expected to have a drastic impact on agriculture notably by impacting water availability, precipitations, temperatures, soil nutrients and the incidence of diseases and pests. A better use of plant genetic resources and plant breeding are key to tackling this challenge from climate change and for food security. Many landraces and wild relatives of crops are conserved in seed and gene banks. These collections are potentially valuable for breeders but are presently underexploited. Moreover, the contribution of the soil microbiome to enhance the performance of specific plant genotypes has been overlooked. The aim is to generate crops that are resistant against biotic stress or can tolerate abiotic stress without significant impact on their performance. Current studies in the field of sensor technologies and phenomics are mainly empirically based and do not link the phenotypic parameters to the molecular scale. Similarly, many molecular studies do not correlate their findings to the whole plant phenotype. The quantitative high throughput analysis of crop potential and behavior during stress is a form of Genotype x Environment interaction and is a major bottleneck. We urgently need to identify resilient genotypes and to understand the underlying mechanisms of this resilience. Phenotyping science is quickly developing to characterize plant behavior, its dynamic dimensions and to quantify features such as growth and stress resilience which increasingly permit to link the phenotype to genetic control.
