An Introduction To High Frequency Finance:

An Introduction to High-Frequency Finance Ramazan Gençay, Michel Dacorogna, Ulrich A. Muller, Olivier Pictet, Richard Olsen, 2001-05-29 Liquid markets generate hundreds or thousands of ticks the minimum change in price a security can have either up or down every business day Data vendors such as Reuters transmit more than 275 000 prices per day for foreign exchange spot rates alone Thus high frequency data can be a fundamental object of study as traders make decisions by observing high frequency or tick by tick data Yet most studies published in financial literature deal with low frequency regularly spaced data For a variety of reasons high frequency data are becoming a way for understanding market microstructure This book discusses the best mathematical models and tools for dealing with such vast amounts of data This book provides a framework for the analysis modeling and inference of high frequency financial time series With particular emphasis on foreign exchange markets as well as currency interest rate and bond futures markets this unified view of high frequency time series methods investigates the price formation process and concludes by reviewing techniques for constructing systematic trading models for financial assets

High Frequency Financial Econometrics Luc Bauwens, Winfried Pohlmeier, David Veredas, 2007-12-31 In this paper we propose a new econometric approach to jointly model the time series dynamics of the trading process and the revisions of ask and bid prices We use this model to test the validity of certain symmetry assumptions very common among microstructure models Namely we test whether ask and bid quotes respond symmetrically to trade related shocks and whether buyer initiated trades and seller initiated trades are equally informative In essence the procedure we propose generalizes Hasbrouck's 1991 vector autoregressive model for signed trades and changes in the quote midpoint by relaxing the implicit symmetry assumptions in his model The properties of the empirical model are derived from a structural dynamic model for ask and bid prices In this model ask and bid prices share a common long run component the efficient price The long term value of the stock varies due to buyer initiated shocks seller initiated shocks and trade unrelated shocks The transitory components of ask and bid prices are characterized by two correlated and trade dependent stochastic processes whose dynamics are allowed to differ The trading process is endogenous Buyer and seller initiated trades are generated by two idiosyncratic but mutually dependent stochastic processes The generating processes of quotes and trades both depend on several exogenous variables that feature the trades and the market conditions

be able to see The book includes a Foreword by Richard Olsen and explores the following topics Data science as an alternative to time series price movements in a market can be summarised as directional changes Machine learning for regime change detection historical regime changes in a market can be discovered by a Hidden Markov Model Regime characterisation normal and abnormal regimes in historical data can be characterised using indicators defined under Directional Change Market Monitoring by using historical characteristics of normal and abnormal regimes one can monitor the market to detect whether the market regime has changed Algorithmic trading regime tracking information can help us to design trading algorithms It will be of great interest to researchers in computational finance machine learning and data science About the Authors Jun Chen received his PhD in computational finance from the Centre for Computational Finance and Economic Agents University of Essex in 2019 Edward P K Tsang is an Emeritus Professor at the University of Essex where he co founded the Centre for Computational Finance and Economic Agents in 2002
