Fig. shows a block of Weight  $W$  on the verge of motion acted upon by force  $P$ . Let  $R$  be the resultant reaction at the contact surface acting at an angle of friction  $\phi$ . If the direction of force is changed by rotating it through  $360^\circ$  in a plane parallel to the contact surface, the force  $R$  also rotates and generates a right circular cone of semi-central angle equal to  $\phi$ . This right circular cone is known as the cone of friction.

Fig.

The significance of cone of friction is that for static body the resultant reaction force at the rough contact surface lies within the cone, while for a static body on the verge of motion, the reaction force lies on the surface of the cone of friction.

### ANGLE OF RESPONSE

It is defined as the minimum angle of inclination of a plane with the horizontal for which a body kept on it will just slide down on it without application of any external force.

Consider a block of weight  $W$  resting on a rough horizontal plane. The plane is slowly tilted till the block is just on the verge of sliding down the plane, Fig. The angle of inclination of the plane at this position is known as the angle of repose. It is denoted by letter  $\alpha$ . Angle of repose is independent of the weight of the body and depends only on the coefficient of static friction. Let us
